January 2020

Executive Summary

The New Forests Company-Uganda (NFC) - began operations in 2005, as part of an integrated East and Southern African Forestry and Timber operation. The company has three plantations and a pole treatment plant in six districts across the country in Mubende, Kassanda, Kiboga, Kyankwanzi and Bugiri districts and operates an administrative and coordination office (headquarters) in Kampala city.

Communities in project areas were faced with a number of social problems including high population growth rates, high poverty rates, low crop yields, and low levels of government service provision. These factors were further exacerbated by a dependency mindset among these communities. To address these issues, NFC in partnership with communities co-designed a new model - “Forests for Prosperity (FP)” program that was piloted in Kirinya Plantation in Bugiri district.

The purpose of this mid-term evaluation is to review FP intervention in relation to building agency, improving community livelihoods and reducing company risks in the project areas.

Results show that formal education was generally low in all the sites and most household heads had not acquired education beyond primary level. Average household daily expenditures was about UGX8,000, far less than US\$1 a day (current rate is US\$1 to UGX3,675) and the amount was generally similar in all project areas. Poverty Rate was generally high and most households were below the poverty line. There was high willingness among both CA and non-CA members in all the sites to mitigate forest risks. Over 40% households perceived their level of skills in forest mitigation as sufficient but a greater percentage indicated the need for NFC to avail protective gear for forest work and avail them fire-fighting tools & equipment.

The study used the Net Promoter Score (NPS) as an index for gauging local communities’ overall satisfaction for services within themselves and with NFC, and their loyalty to such services. It was shown that overall, NPS value raised by 23 points since the time of baseline assessment - from 32 to 55. This rise of 23 points in one calendar year is an indicator that Forests for Prosperity is being embraced at a fast rate as good practice among communities and that Forests for prosperity activities could turn out to be self-propagating in future. Results also indicate that NPS scores of CA members against their own Associations were highest in Mityana (83.3) and lowest in Namwasa communities (40). Similarly, NPS scores of communities against NFC were highest in Mityana (60) and lowest in Namwasa communities (35). This revelation deviates greatly from what was seen during the Baseline Study where Mityana communities trailed in all aspects. This new development has been attributed to enhanced levels of awareness creation in Mityana and probable attention by Mityana residents on opportunities emanating from joint ventures with NFC.

There has been a firm foundation laid for improving the household perception of the agency of Community Associations. To that effect, the number of CA-Members that can define the goals/ aspirations of their Community Association in Kirinya, Luwunga, Namwasa and Mityana Pole Plant is 81.4%, 100%, 95.9 and 87.2% respectively.

However there has been no corresponding increment in the appreciation of the level to which these aspirations can be realized by the individual members without external output. This may be a reflection of the continued prevailing belief that problems have to be solved by or with help of government or external superior entity.

This survey also re-evaluated micro-insurance services in the project sites. In-depth interviews in FGDs and key informants showed that micro insurance services are accessed as part of the microloans received by community members from OBUL on recommendation by NFC. OBUL uses ICEA and UAP to insure loans received by CA members. Even with current innovations in the insurance industry, it was noted that there was still a generally low insurance uptake. Current efforts still need be invigorated to incentivize NFC neighboring communities to take up such insurance services.

Based on results from this Study, a series of recommendations were made, viz:

- Whereas FP has taken root in Bugiri, its replication in other project areas has taken a fast pace that needs careful attention so as to manage expectations.
- Whereas there has been a general rise from out of rock-bottom poverty levels in all project areas, much still needs to be done in this regard if efforts initiated in the pilot are not to go to waste.
- Whereas there has been reasonable agency, continuous awareness raising and capacity building is necessary for the communities to know that CAs actually belong to them and not NFC. This will also increase the sustainability of CAs.
- The willingness of communities to participate in forest risk mitigation is still generally high but there is need for logistical support in form of tools, equipment and protection gear to perform forest protection tasks.
- NFC's prioritization and engagement with communities in Mityana to improve their relations with this Forests Company has paid-off and Mityana communities are now fully on board with regard to FP activities.
- The aspect of micro insurance is still limited only to credit micro-insurance and needs to be enhanced further.

ACKNOWLEDGEMENT

The Consultant wishes to acknowledge organizations and individuals who have supported them in pursuit of this assignment.

First and foremost, we thank the management of New Forest Company who offered us the opportunity to undertake this assignment. Their head office in Kampala provided the team with all the needed support. Particular thanks are due to Mr. Alex Kyabawampi, Executive Director of the New Forests Foundation.

We thank the management and staff of NFC Field Offices at Kirinya Plantation, Mityana Pole Plant, Namwasa Plantation, and Luwunga Plantation who excellently supported the team and effectively coordinated the assignment activities. Special mention is due to:

- Ms. Joan Asiimwe;
- Ms Winnie Ajambo;
- Mr. Joel Bagatya;
- Mr Mathew Mapfumo
- Mr. Odoi Valentine;
- Ms. Sheila Awori
- Ms Fiona Akello
- Mr Charles Gitta;
- Mr Nicholas Tuhamize and
- Mr. Sanya Paul.

Special thanks are also due to the management and staff of Opportunity Bank who provided the vital support to the consultant's team.

Finally, the technical and political leadership and staff of Bugiri, Mityana, Mubende, Kassanda , Kiboga and Kyankwanzi District Local Governments and Mityana Municipal Council were available to meet as well as provide us with the required data to facilitate the assignment. The Team of Consultants is grateful to them all.

1. Introduction

1.1. Overview of the New Forests Company (NFC)

The New Forests Company-Uganda- began operations in 2005, as part of an integrated East and Southern African Forestry and Timber operation. Thus, the Company has been in existence for one- and- a- half decades. The Company has rapidly established itself as Uganda's biggest private tree planter with more than 20,000 hectares of forestry land and is emerging as the country's pre-eminent sustainable forestry company. It is now operational on three plantations across the country in Mubende, Kassanda, Kiboga, Kyankwanzi and the Bugiri districts and has, by the end of 2009, planted 6,780 hectares of pine and eucalyptus.

The company is currently exploring new ways to generate early revenues and has completed the construction of a pole treatment plant close to Mityana, known as the East Africa Pole Company. Sustainable commercial forestry and the protection and promotion of biodiversity is combined with a carefully designed programme of community participation and benefit which aims to create jobs, boost rural incomes, help lower levels of poverty, improve health and develop a thriving local private sector. The workforce on all three plantations is well over 1,400.

The Forests for Prosperity (FP) programme was a pilot community engagement and risk mitigation approach designed by the communities in Bugiri who neighbor NFC's Kirinya plantation. After doing a satisfaction and feedback survey with community members, NFC learned, among others, that communities are not satisfied with the services rendered in the social infrastructure projects. As a result of this feedback, NFC saw that the social infrastructure projects were not achieving the objectives of the Corporate Social Responsibility programme neither the objectives of the community. In response to this situation, the NFC team sat with the representatives from the communities around the plantation in Bugiri to discuss the feedback and together design a new model that more directly aligned their interests. The community designed the Forests for Prosperity model where villages organize at a parish level into Community Associations (CAs) who are contracted to mitigate risks in their area of the plantation based on mutually agreed indicators. At the end of the year, the company pays the CAs based on their performance. The company has also invested massively in capacity building to address gaps/needs identified by CAs. Both parties are benefitting so much from this programme that the company has now scaled up Forests for Prosperity to the other plantations and its pole treatment plant. A midterm review is necessary for the company and the community to understand what is working and what is not working about the FP programme.

The objectives of FP are to: directly align community interests of prosperity with NFC's interests of a thriving, well protected forest; measurably reduce risks to plantation in a cost-effective way; measurably increase economic prosperity and agency among neighboring communities; increase agency among neighboring communities through co-designing and participatory decision-making throughout; and build a system that underpins a long-term, mutually beneficial relationship between NFC and communities. The NFC operates an administrative and coordination office (headquarters) in Kampala and has field operations in 6 districts as follows:

- Kirinya Plantation in Bugiri District
- Namwasa Plantation in Kassanda and Mubende Districts
- Luwunga Plantation in Kiboga and Kyankwanzi Districts
- Pole Treatment Plant in Mityana District

1.2. Description of Study areas

1.2.1. Kirinya Plantation Area

Communities peripheral to Kirinya plantation are a mix of Basoga, Samia and Adhora tribes. Lusoga is the predominantly spoken *lingua franca* but Samia and Adhora languages are also spoken. The communities were initially fishing communities but changed upon Uganda government implementing stricter measures to curb illegal fishing on all lakes. They are currently involved in subsistence farming where they grow crops predominately for home consumption and a little surplus is sold to get money for the basic necessities such as paraffin, match boxes, salt and soap.

The crops grown include cassava, beans, maize and potatoes. The main cash crop is coffee, although major food crops frequently end up in market due to demand. To some extent, the community has adapted commercial tree growing – thanks to NFC – but this is still at a very low level.

Majority of residents dwell in iron roofed houses whose walls are mostly of mud and wattle. Extremes on both sides from this general situation are however represented ie – there are community members still living in grass thatched houses while others stay in iron roofed houses with brick walls.

1.2.2. Mityana Pole Treatment

Mityana Poles Treatment Plant is located on the outskirts of Mityana Municipality. In terms of general social economics, the community peripheral to Mityana Pole treatment plant can be described as peri – urban, with lifestyles mimicking those of urban dwellers but lacking in the economic activities that would characterize urban locations. The

residents there are a cosmopolitan lot with Baganda and western tribes such as Banyankole and Banyarwanda dominating but with representation of some northern tribes such as the Lugbara and Alur. Luganda is the predominantly spoken *lingua franca* but Lunyankole, Kiyarwanda and Kiswahili languages are also widely spoken. They are currently involved in subsistence farming where they grow crops predominantly for home consumption and a little surplus is sold to get money for the basic necessities such as paraffin, match boxes, salt and soap. Quite a number of residents are involved in trading of produce and other related petty trade.

The main food crops grown include plantains, beans, maize, cassava and sweet potatoes. Coffee is the main cash crop. To some extent, the community has adopted commercial tree growing – thanks to NFC – but this is still at a very low level.

The people mostly dwell in iron roofed houses with brick walls with a few living in iron roofed houses with mud and wattle walls.

1.2.3. Namwasa

Communities peripheral to Namwasa plantation are a mix of Baganda, Banyankole and Banyarwanda tribes. Luganda is the predominantly spoken language but Lunyankole and Kinyarwanda/ kifumbira languages are also widely spoken. The communities were initially cattle keepers but they changed to subsistence farming upon loss of their herds and reduction in grazing grounds. They are currently involved in subsistence farming where they grow crops predominately for home consumption and a little surplus is sold to get money for the basic necessities such as paraffin, match boxes, sugar, salt , soap and health care.

The major food crops grown include plantain, beans, maize and irish potatoes. Coffee is the main cash crop grown. To some extent, the community has adopted commercial tree growing – thanks to NFC – but this is still at a very low level.

Mining of gold and other precious metal takes place in the vicinity of Namwasa Plantation, albeit on a small scale. Due to the secrecy associated with the activity, it was not possible to get the details of the number of people involved in this activity.

The residents mostly dwell in iron roofed houses with brick walls with a few staying in iron roofed houses with mud and wattle walls.

1.2.4. Kiboga

Communities peripheral to Luwunga plantation are a mix of Baganda, Banyankole and Banyarwanda tribes. Luganda is the predominantly spoken language but Lunyankole

and Kinyarwanda languages are also widely spoken. The communities practice mixed farming on a small scale. Livestock Farming - mainly cattle keeping is practiced on a relatively larger scale.

The major food crops grown include bananas, beans, maize and cassava. Coffee is the main cash crop grown. To some extent, the community has adopted commercial tree growing – thanks to NFC – but this is still at a very low level.

The people mostly dwell in iron roofed houses with brick walls with a few living in iron roofed houses with mud and wattle walls.

1.3. Geographical location:

NFC has forest operations in four project areas located in six districts namely:

- Kirinya Plantation in Bugiri District,
- Namwasa Plantation in Kassanda and Mubende Districts,
- Luwunga Plantation in Kiboga and Kyankwanzi Districts, and
- Pole Treatment Plant in Mityana District.

Figure 1 below shows the approximate locations of the above project areas.

Figure 1: Map Showing Approximate Locations of NFC Activities

1.4. NFC interactions with neighboring communities

In the past, NFC experienced turbulent relations with communities surrounding its establishments especially in Luwunga and Namwasa. In December 2011, affected community representatives, with the support of Oxfam International, Oxfam Great Britain, and the Uganda Land Alliance, lodged a complaint on behalf of community members affected by the New Forests Company's Namwasa plantation in Mubende District ("Namwasa") and Luwunga Plantation which straddles the Kiboga and Kyankwanzi Districts ("Luwunga"), Uganda.

The complaint raised concerned forced evictions and displacement in plantation areas. Representatives of the affected communities claimed that the evictions had negatively impacted their communities by displacing them from land, destroying their private property, and forcing them to forgo health, education, and livelihood opportunities. The complaint also voiced broader concerns about the due diligence surrounding the project, including the lack of genuine or meaningful consultation around the evictions, the lack of a baseline study or survey to accompany the process, and the lack of due diligence on the part of New Forests Company. Some representatives of the affected communities also stated that they had experienced violence against themselves, their families, and their personal property from security forces, which they believed belonged to or acted with full knowledge and consent of NFC. The Office of the Compliance Advisor / Ombudsman from the International Finance Corporation initiated and concluded a process to resolve this dispute, which resulted into the formation of Cooperatives through which affected members were compensated and facilitated to resettle Matt Grainger and Kate Geary (2011).

The mediation process proposed and accepted by all parties aimed at finding an acceptable and workable solution between the affected community and NFC ("parties"). The mediator also facilitated direct bi-lateral discussions and negotiation sessions between the parties, and assisted the parties in developing greater understanding of issues at hand. Thereafter, parties reached agreement on a range of principles. In essence, and in terms of the Framework Agreement signed by the parties, the parties agreed on a joint programme of sustainable development aimed at benefiting affected communities. The parties agreed to the following aspects being made public:

NFC undertook to provide significant support to a Cooperative Society representing affected communities, expanding its Cooperate Social Responsibility (CSR) investment programme to meet some of the specific needs of these communities. NFC also agreed to work closely with the community and build more solid mutually beneficial relations. The affected community, on the other hand, agreed to respect NFC's legal rights and the boundaries of the Government of Uganda's forest reserve, to act lawfully and to engage with the company to develop long term cooperation and co-habitation-Ombudsman Assessment Report (2012)

The parties agreed to work closely together on a range of programmes and projects aimed at long term sustainable development, and building strong and lasting good relations between them. The complaints were formally closed by the Office of Compliance Advisor Ombudsman as confirmed by reports on the websites viewed in January 2020: http://www.cao-ombudsman.org/documents/CAOMubendeConclusionReport_February2018_English.pdf and <http://www.cao-ombudsman.org/cases/document-links/documents/ConclusionReportAgriVie-Fund-01-Kiboga.pdf>

Since then, NFC through the NFF has made great strides strengthening community engagement through CSR projects first through infrastructure development and, now, the FP program, which has taken strong route in Kirinya and is being rolled out to other project areas. FP is particularly important for Kiboga and Mubende to replace the void created in social engagement after the conclusion of the Ombudsman process. FP is also more significant as it engages and allows participation by all the communities neighbouring the Luwunga and Namwasa Plantations and not just the Oxfam complaint affected communities.

1.5. Overview of Forests for Prosperity Programme

The Forests for Prosperity (FP) programme was a pilot community engagement and risk mitigation approach designed by the communities in Bugiri who neighbour NFC's Kirinya plantation. After doing a satisfaction and feedback survey with community members, NFC learned, among others, that communities are not satisfied with the services rendered in the social infrastructure projects. As a result of this feedback, NFC saw that the social infrastructure projects were not achieving the objectives of the Corporate Social Responsibility programme neither the objectives of the community. In response to this situation, the NFC team in consultation with the representatives from the communities around the plantation in Bugiri discussed the feedback and together designed a new model that would be more directly aligned their (community's) interests. FP has now been rolled up and scaled up to the plantations at Luwunga, Namwasa and the Pole Plant.

The community designed the Forests for Prosperity model where villages organize at a parish level into Community Associations (CAs) who are contracted to mitigate risks in their area of the plantation based on mutually agreed indicators. At the end of the year, the company pays the CAs based on their performance. Both parties are benefitting so much from this programme that the company is now planning to replicate it at the other plantations. A mid term is necessary for the company and the community to understand what is working and what is not working about the FP programme.

The objectives of FP are to: directly align community interests of prosperity with NFC's interests of a thriving, well protected forest; measurably reduce risks to plantation in a cost-effective way; measurably increase economic prosperity and agency among neighboring communities; increase agency among neighboring communities through co-designing and participatory decision-making throughout; and build a system that underpins a long-term, mutually beneficial relationship between NFC and communities.

2. Objective of the Consultancy

2.1. Rationale and Context of the Study

NFC commissioned a mid-term review of the Forests for Prosperity (FP) programme in order to establish whether FP is achieving its goals of improving community livelihoods and reducing company risks across all its operations in Uganda – plantations and pole plant.

The consultants were required to focus the mid-term evaluation on five thematic impact areas namely: Community Prosperity; Forest Risk Mitigation; Relationship Indicators; Agency; and Micro-insurance. They were also required to assess changes (if any) in socio-economic state of the communities, economic activity within the CAs, benefits accruing from relationships with Micro-finance institutions (MFIs), financial literacy levels, and trust and animosity within CAs. They were required to assess the extent knowledge, willingness and capacity to support forest risk mitigation has changed among CA and non-CA members relative to the baseline, and to triangulate findings on these parameters with risk incidence scores available from Monthly Monitoring Reports. They were further required to assess changes in the level of trust and animosity between the communities and NFC and the level of agency people feel to solve their own problems as well as establish whether any schemes exist that can provide affordable micro insurance products to CAs and NFC labourers.

2.2. Specific Objectives

According to the client's Terms of Reference (See Annex II), the Consultants were expected to probe the following:

2.2.1. Community Prosperity:

- Assess the current socio-economic state of the communities, ie: Poverty Probability Index
- Assess economic activity within the CAs, i.e.: # of loans, average size of loan, demographics of loan recipients, interest rate, average duration of loan, types of activities loans contribute toward, perception of loan

recipient on impact of loan on household livelihoods, CA income statement, CA balance sheet

- Assess benefits of Opportunity Bank relationship, i.e.: # of loans, average size of loan, demographics of loan recipients, interest rate, average duration of loan, types of activities loans contribute toward, perception of loan recipient on impact of loan on household livelihoods
- Assess financial literacy levels (particularly comparing CA members with non-CA members)
- Trust and Animosity within CAs, i.e.: Net promoter Score (NPS) for their leaders

2.2.2. Forest Risk Mitigation:

- Understanding of how to mitigate risks, i.e.: do they know what they are and how to prevent them?
- Willingness to mitigate risks, i.e.: how likely are they to help NFC reduce risks?
- Triangulate these and other scores with risk incidence scores available from the Monthly Monitoring Reports during analysis

2.2.3. Relationship Indicators:

- Trust and Animosity between the communities and NFC, i.e.: Net promoter Score (NPS) for CAs, FP programme and for NFC to compare across demographics

2.2.4. Agency:

- Level of agency people feel to solve their own problems, please note in your proposal the recommended best practice ways of measuring this

2.2.5. Micro insurance:

- Establish whether any schemes exist that can provide affordable micro insurance products to communities and NFC labor (low income groups who earn about Ugx10,000 per day)

2.3. Report structure

This mid-term review report is structured in four Chapters as outlined below:

- Chapter 1 covers the introduction of the assignment inclusive of Background of New Forests Company and Forests for Prosperity program.
- Chapter 2 deals with the approach and methodology used in undertaking the assignment.
- Chapter 3 presents the results of the assignment while chapter 4 presents the Conclusions and Recommendations as well as the challenges encountered when undertaking the assignment.

- Finally, these chapters are complemented with annexes of vital information that could not be included in another part of the report.

2.4. Approach and Methodology

A number of methods were used to arrive at results required in this Baseline Study as follows:

2.4.1. Literature Review

A desk review of literature and project documents was carried out. The project documents reviewed include Social Development Policy, NFC Community Development Strategy, Strategic Plan, NFC Sustainability Reports and documents, agreements with partners, the FP Program reports (Annual, Quarterly and Monthly) and Reports on Corporate Social Responsibilities. Other documents reviewed were the National Population and Housing Census 2014 Report (Uganda Bureau of Statistics, 2016) and relevant policy documents regarding tree planting in Uganda. The review of literature was intended to get a deep understanding of the implementation of the FP Project and the indicators of monitoring and evaluating the progress, outcomes and impact of the Project. Further, the desk review was important for designing and implementing the methodology of the baseline survey.

Besides the documents that were reviewed, tools to guide the under mentioned data collection processes were designed and shared with the client's representatives for input and/or approval. Final versions are in Annex II and III.

2.4.2. Field Survey

This method was especially important in collection of baseline information at community and household levels. The field survey employed a number of different methods namely:

2.4.3.1. Community Consultative Meetings

Consultative meetings were conducted in all the study sites in the six districts in the project areas using a pre-determined checklist (Figure 2). The meetings were intended to create awareness of the field exercise to be conducted and to locate sites during sampling. The meetings also obtained information on key economic activities, and institutional arrangements within study sites. While recognizing the gender sensitivity, in attendance, the meetings comprised of local leaders opinion leaders, community elders and private forest owners.

Figure 2: Community Consultative Meeting in one of the NFC sites

2.4.3.2. Household Survey

A household survey was conducted among forest adjacent communities (Figure 3). Household interviews were administered to a randomly selected sample of households in the four NFC sites in the six districts. The household survey focused on the Community Prosperity, Forest Risk Mitigation: Relationship Indicators: Agency: Micro insurance.

Figure 3 Household Surveys going on in one of the NFC sites

2.4.3.3. Focus Group Discussions and village survey

Focus Group Discussions (FGD) (Figure 4) were used to assess current socio-economic state of communities, economic activity within the Community Associations, understand how loans are used by the community and establish the perception of loan recipients on the impact of loans on household livelihoods. Further, in-depth information from members of Community Associations was important to assess their level of awareness of forest protection risks and their mitigation as well as to assess their willingness to participate in forest risk mitigation. Information from FGDs was also used to triangulate and/or clarify quantitative information captured from individual households.

Figure 3: FGD going on in one of the NFC sites

2.4.3.4. Key informant interviews

Key informant interviews (Figure 5) were conducted before and after the household surveys. Individuals engaged in key informants included staff from NFC, NFA, forest district officers and NGOs supporting tree planting in the six districts. The interviews

were intended to provide deeper understanding of responses from households and FGDs.

Figure 4: Key informant interview going on in one of the NFC sites

2.4.3. Sampling Procedure

This mid-term review was conducted among a randomly selected sample of households in the four NFC sites in the six districts. The households constituted members of forest adjacent communities. Based on the information from the document reviews and in consultation key informants, sampling frames were established. From the sampling frames statistically representative samples were selected. The sampling procedure ensured inclusion and representation of different demographic categories, locations in the NFC sites and major activities they were involved in. Some of the strata considered in sampling were CA membership, NFC labor and affected cooperative members. Sampling procedures followed lists of the households in each stratum where random selection was done to get the final sample to be interviewed. Probability proportional to size sampling technique was used allocate the sample of 472 households to the different strata and NFC sites. These households were distributed in the four NFC sites as follows: 119 households in Kirinya (Bugiri district), 110 in Mityana Pole Treatment Plant (PTP) Mityana district, 123 in Namwasa (Kasanda and Mubende districts), and

120 households in Luwunga (Kiboga and Kyankwanzi districts). Also, six Key Informant interviews were done in each of the four project areas.

2.4.4.1 Poverty Probability Index (PPI)

The New Forests Company Forests for Prosperity mid-term review utilized a poverty Scorecard and Look-up tables to assess household poverty levels and poverty rates of groups of households in particular categories and locations of the study population.

All points in the scorecard are non-negative integers, and total scores range from 0 (most likely below a poverty line) to 100 (least likely below a poverty line).

Poverty scoring can be used to estimate three basic quantities. First, it can estimate a particular household's poverty likelihood, that is, the probability that the household has per-adult-equivalent or per-capita consumption below a given poverty line.

Second, poverty scoring can estimate the poverty rate of a group of households at a point in time. This estimate is the average of poverty likelihoods among the households in the group.

Third, poverty scoring can estimate changes in the poverty rate for a group of households (or for two independent samples of households, both of which are representative of the same population) between two points in time. For households in the group(s), this estimate is the average follow-up poverty likelihood versus the average baseline likelihood.

All three scoring-based estimators (the poverty likelihood of a household, the poverty rate of households at a point in time, and the change in the poverty rate of households over time) are unbiased. That is, they match the true value on average in repeated samples when constructed from (and applied to) a single, unchanging population in which the relationship between scorecard indicators and poverty is constant. The scorecard works on the assumption that future relationships between indicators and poverty in all possible groups of households will be the same as in the construction data.

The New Forests Company Forests for Prosperity mid-term review utilized Uganda PPI 2012 Scorecard and Look-up tables. This PPI was created in June 2015 by Mark Schreiner of Microfinance Risk Management L.L.C using data from Uganda's 2012/2013 National Household Survey that was conducted by Uganda Bureau of Statistics (UBOS). Proxy information about daily household expenditure/daily household consumption (Poverty Probability Index) was obtained using ten (10) standard questions

with total score per household computed by adding respective scores for each of the ten (10) questions. A PPI score for each household was converted into a poverty-likelihood for each household using a PPI Look-up Table. The Review utilized Look-up Tables that indicated PPI Scores for \$1.25/day 2005 PPP (Purchasing Power Parity). The corresponding poverty likelihoods were the basis for analysis of household poverty levels and poverty rates for groups of households in particular categories and locations of the study population.

2.4.4.2 Availability and Benefits of Financing from Loans from OBUL

The economic activities within the CA inclusive of availability and benefits of financing from OBUL were assessed qualitatively through focus group discussions with the CA members and Key Informant Interviews with staff of OBUL.

2.4.4.3 Community understanding of how to mitigate risks

The consultant engaged respondents to find out their level of understanding of the risk/threats that confront NFC establishments at the various locations. A check-list of threats/risks identified by the consultant prior to the interviews was used to guide responses. This included forest fires, theft of plantation forest produce, agricultural encroachment, illegal grazing, illegal hunting, illegal charcoal production, illegal felling of trees in the conservation areas (wetlands) and others.

The **Net Promoter Score** was used as an index (ranging from -100 to 100) that measured willingness of local communities to recommend NFC services to others. It was used as a proxy for gauging the local communities overall satisfaction with NFC services and their loyalty to such services.

NPS was calculated using the answer to a key question, using a 0-10 scale: “How likely is it that you would recommend (a CA or NFC) to a friend or colleague?”

Respondents were grouped as follows:

Promoters (score 9-10) were loyal enthusiasts who would refer others, fueling growth.

Passives (score 7-8) were satisfied but unenthusiastic customers who are vulnerable to competitive offerings.

Detractors (score 0-6) were unhappy customers who can damage the brand and impede growth through negative word-of-mouth.

Subtracting the percentage of Detractors from the percentage of Promoters yielded the Net Promoter Score, and this could range from a low of -100 (if every customer is a Detractor) to a high of 100 (if every customer is a Promoter).

A positive NPS (i.e., one that is higher than zero) is generally deemed good, and an NPS of +50 is generally deemed excellent.

2.4.4.4 Agency

The concept of agency is applicable to both individuals and groups. The data collection tool was designed to capture agency of only community association (members) as guided by the terms of reference. The Client required the Study Team to investigate the Agency of Groups/Community Associations. We found that the Client was inclined to working with existing organized groups around Kirinya Plantation and where existing groups were lacking in organization, attempts were made to form new groups as was the case for Mityana Pole Treatment Plant, Namwasa Plantation, and Luwunga Plantation.

Therefore focusing on investigation of Agency of Groups/Community Associations was deliberate and the team deemed it necessary to follow this line of approach. Consequently data on this theme was mostly collected from Community Association members' HHs as was intended. Analysis of this theme was therefore, limited to ascertaining the agency of the community associations as outlined below.

- 4 in Kirinya (Balikyegomba Wakawaka Farmers Association; Agali Awamu Farmer Field School; Gema Kumwino Credit and Saving Farmer Group; Kyabakaire Group)
- 2 in Mityana (Businzigo Tusitukirewamu Development Association; Nalugazi Tweekembe Development Association)
- 5 in Mubende/Kasanda (Mubende-Bukakikama Cooperative Society; Kiryajjobyo Community Association; Kisita Development Group; Kicucula Twegatte Community Association; Mpologoma Twezimbe Community Association)
- 5 in Kiboga (Kiboga Twegatte Cooperative Society; Kika Farmers Association; Nabuwa Forest Protection Development Association; Namugoye United Association; Kwagalana Kabada-Bumakya Farmers Group)

Comparison between levels of Agency (of Community Associations) at the different locations is done to understand how the same varies from one project location to another.

Agency is difficult to measure directly, and it is best delivered by proxy. The possible approaches are as varied as the understanding of the concept by different individuals. And therefore the findings here must along those lines be understood to be indicative rather than absolute. With this approach, the consultant opts to be approximately/generally right instead of trying to be precise but turn out to be exactly wrong.

Recognizing that agency is generally complex and difficult to measure directly, and it is best delivered by proxy. For literature, the approaches used to assess agency are as vary depending on understanding of the concept by different individuals. In

this survey the textual definition of agency was ability of the group or an individual to understand its aspiration and act on its own in pursuit of that aspiration. In other words, agency is a form empowerment – the ability to determine your destiny unaided. This derived from works of Amartya Sen (1985, 1987, 1999) and Sabine Alkire (2002, 2005 and 2007) A combination of raw talent and enabling environment does not always translate to accomplishment. Amartya Sen (1985) noted “that a person could have a great deal of freedom, without achieving much”. Therefore, for purpose of this baseline, Agency is understood to be that intrinsic drive (of an individual or organization) to achieve the desired aspiration.

This general approximation of agency uses information from agency of the individual members to derive that of the community association.

- a) From an individual CA member, the interest is to understand:
 - (i) The extent to which one CA member is aware of her/his desired future “fate” or “destiny” through an “aspiration”
 - (ii) The extent to which she/he believes she/he can on her/his own act or realizing their (her/his) “aspiration”
- b) Upon contextualizing the above to the group (CA), the CA agency can be derived from the understanding of the under mentioned
 - (i) To what extent are the group (CA) members aware of their aspiration of the community association?
 - (ii) To what extent do the members of the association believe they can realize their aspiration (desired destiny/fate) on their own action?

2.4.4.5 Micro insurance

Micro insurance is the protection of low-income people against specific perils in exchange for regular premium payments proportionate to the likelihood and cost of the risk involved. (Qureshi, Wohlner, McCord, and Patel 2003)

The current providers of micro finance services in the areas of interest were used as the entry point to understanding the possible providers of micro-insurance to the members of the community (associations). Interviews were held with key informants from the OBUL as a basis for ascertaining the potential availability of micro insurance providers.

2.4.4. Data Collection Tools

The data collection tools used were questionnaires (*Annex III*) for the household survey, and interview guide (*Annex IV*) for the FGD. The questionnaire and checklists were structured based on the required data/indicators for the three Project Component

thematic areas. The design of the questionnaire and checklists was mindful to contain all the questions relevant for the needed data. The draft data collection tools were shared with the NFC Technical Staff to ascertain the quality and adequacy of the tools. The tools were accordingly revised and the pre-tested before administering them.

2.4.5. Data collection methods

Qualitative and quantitative primary data were collected. Each of the thematic areas had different data requirements which needed different methods of collection. Table 1 shows a summary of the data requirement and methods and tools of data collection in relation to the objectives and activities for each Project component.

Table 1: Data Requirements for the Mid-Term Review

Thematic area	Specific Data Requirement	Methods
Community Prosperity:	The current socio-economic state of the communities, particularly Poverty Probability Index; economic activity within the CAs; benefits of Opportunity Bank relationship, Compare the financial literacy levels between CA members and non-CA members.	Household survey, FGDs, Village survey, Key informant interviews
Forest Risk Mitigation:	Community understanding of how to mitigate risks of forest plantation, the community willingness to participate in mitigating forest plantation risks.	Household survey, FGDs, Village survey.
Relationship Indicators:	Level of trust and animosity between the communities and NFC, i.e.: Net promoter Score (NPS) for CAs, FP programme and for NFC	Household survey, Focus Group Discussions,
Agency:	Level of agency across different community demographic categories.	Household survey, FGDs
Micro insurance:	Existence of possible schemes that provide affordable micro insurance services to communities and NFC labors and other low income groups.	Household survey, FGD, Village survey, Key informant interviews

2.4.6. Method for Processing and Analysis

The collected data were cleaned and stored in computer spreadsheets (MS Excel and Stata). The analysis and presentation of the results were made in reference to the different objectives of the Project Components, and guided by the TOR to ensure that all the indicators needed for future monitoring and evaluation were captured. The methods employed included: computing means, percentages and rankings. A more detailed description of data analysis methods for each Component and objectives are presented under the respective Sections and Chapters of this report.

2.4.7.1 Analytical Methods for Community Prosperity

This thematic area was intended to assess the current socio-economic state of the communities, particularly Poverty Probability Index; economic activity within the CAs,

benefits of Opportunity Bank relationship and to compare the financial literacy levels between CA members and non-CA members.

The Poverty Probability Index (PPI), was computed using a poverty Scorecard and Look-up tables to assess household poverty levels and poverty rates of groups of households in particular categories and locations of the study population. In the scorecard all points are non-negative integers and total scores range from 0 (most likely below a poverty line) to 100 (least likely below a poverty line). Poverty scoring can be used to estimate three basic quantities (Kshirsagar. 2017). First, it can estimate a particular household's poverty likelihood, that is, the probability that the household has per-adult-equivalent or per-capita consumption below a given poverty line. Second, poverty scoring can estimate the poverty rate of a group of households at a point in time. This estimate is the average of poverty likelihoods among the households in the group.

Third, poverty scoring can estimate changes in the poverty rate for a group of households (or for two independent samples of households, both of which are representative of the same population) between two points in time. For households in the group(s), this estimate is the average follow-up poverty likelihood versus the average baseline likelihood. All three scoring-based estimators (the poverty likelihood of a household, the poverty rate of households at a point in time, and the change in the poverty rate of households over time) are unbiased. That is, they match the true value on average in repeated samples when constructed from-and applied to a single, unchanging population in which the relationship between scorecard indicators and poverty is constant.

This survey used Uganda PPI 2012 Scorecard and Look-up tables. This PPI was created in June 2015 by Mark Schreiner of Microfinance Risk Management L.L.C using data from Uganda's 2012/2013 National Household Survey that was conducted by Uganda Bureau of Statistics (UBOS). Proxy information about daily household expenditure/daily household consumption (Poverty Probability Index) was obtained using ten (10) standard questions with total score per household computed by adding respective scores for each of the ten (10) questions. A PPI score for each household was converted into a poverty-likelihood for each household using a PPI Look-up Table. The Study utilized Look-up Tables that indicated PPI Scores for \$1.25/day 2005 PPP (Purchasing Power Parity). The corresponding poverty likelihoods were the basis for analysis of household poverty levels and poverty rates for groups of households in particular categories and locations of the study population.

The scorecard works on the assumption that future relationships between indicators and poverty in all possible groups of households will be the same as in the construction data.

2.4.7.2 Analytical Methods for Community Understanding of How to Mitigate Risks

This thematic areas aimed to assess the community understanding of how to mitigate risks in forest plantation; and the community willingness to participate in mitigating forest plantation risks. The analytical approach included generating frequencies and percentages of households who were aware of forest plantation risks. The fire incidences reported at each site were triangulated with fire incidences recorded at NFC to assess the knowledge gap in understanding fire hazards. Further we computed the percentages of households willing to participate in risk mitigation activates. These percentages and frequencies were compared across different demographic and socio-economic categories as stipulated in the TOR.

2.4.7.3 Analytical Methods for Relationship Indicators

Under this theme we intended to assess the level of trust and animosity between the communities and NFC and within community associations. The NPS was used as a measure of trust and animosity between the communities and NFC and between communities and CA leaders. In this survey the NPS were used as a proxy for gauging the local communities overall satisfaction with NFC services and their loyalty to such services. To generate the NPS for NFC household heads/ respondents and CA leaders were asked how likely they would recommend another CA to engage with NFC, on a scale of 1-10. Similarly, to generate the NPS for CA leaders, household heads/ respondents were asked how likely they would recommend a friend or relative to become a member of their respective CA, on a scale of 1-10.

Depending on their scores, respondents were categorized as either promoters, passives, or detractors. Promoters constituted the category of individuals who a score of 9-10. These were perceived as loyal enthusiasts who would refer others, fueling growth. Passives constituted the category of individuals that allocated a score of 7-8. These were perceived as satisfied but unenthusiastic individuals who are vulnerable to competitive offers. Detractors constitute the category of individuals who allocated a score of 0-6. These are perceived to be unhappy individuals who can damage the investments and impede growth through negative word-of-mouth. The percentage of households in each of the three categories above were then generated.

To compute the NPS, the percentage of detractors was subtracted from the percentage of promoters. The NPS ranges from a low of -100 (If every customer is a Detractor) to +100 (if every customer is a Promoter). However, the general interpretation of the NPS is that a positive NPS (higher than zero) is generally deemed good while an NPS of +50 is generally deemed excellent.

2.4.7.4 Analytical Methods for Agency

The concept of agency is applicable to both individuals and groups but in this survey analysis of agency was limited to community associations. We used agency of the individual members to derive that of the community associations. In this baseline survey the contextual definition of agency was the extent to which CAs can independently stand on their own towards achieving their goals and aspirations without external patronage and physiological support. Following this definition this survey generated indicators for measuring the level of agency. At the level of individual CA members, agency was assessed as follows:

- i. The extent to which one CA member is aware of her/his desired future “fate” or “destiny” through an “aspiration”
- ii. The extent to which she/he believes she/he can on her/his own act on realizing (her/his) “aspiration”

The agency of CAs was then derived from the agency of CA members as follows:

- i. The extent to which CA members are aware of their aspiration of the CA in which they belong.
- ii. The extent the members of the association believe they can realize their aspiration and desired destiny/fate on their own action as a group.

2.4.7.5 Analytical methods for Micro insurance

In this baseline survey micro insurance is regarded important for protection of low-income earners against specific risks and cost involved in the risk. To obtain the status of micro-insurance and use in the communities, interviews were held with key informants from the OBUL and other potential micro insurance service providers. The current providers of micro insurance services in the areas of study were used as the entry point to understanding the availability of micro-insurance services to the members of the community.

2.5. Preparing the Mid-Term Evaluation Report and Accompanying Dataset

After processing and analyzing the data, the Consultant Team was entirely responsible for writing the mid-term report and submitting it to the Client. The report structure and content of the report ensures adequacy in addressing the objectives of the study as outlined in the Terms of Reference. The report highlights key indicators against which the interventions of FP Project will be monitored and impact measured in the future. Cleaned datasets used in writing the report were submitted to the Client for further reference.

3. Results

3.1 Community Prosperity

3.1.1. POVERTY PROBABILITY INDEX

The New Forests Company Forests for Prosperity Midterm Evaluation utilized a Poverty Scorecard and Look-up tables to assess household poverty levels and poverty rates of groups of households in particular categories and locations of the study population.

All points in the scorecard are non-negative integers, and total scores range from 0 (most likely below a poverty line) to 100 (least likely below a poverty line).

Poverty scoring can be used to estimate three basic quantities. First, it can estimate a particular household's poverty likelihood, that is, the probability that the household has per-adult-equivalent or per-capita consumption below a given poverty line.

Second, poverty scoring can estimate the poverty rate of a group of households at a point in time. This estimate is the average of poverty likelihoods among the households in the group.

Third, poverty scoring can estimate changes in the poverty rate for a group of households (or for two independent samples of households, both of which are representative of the same population) between two points in time. For households in the group(s), this estimate is the average follow-up poverty likelihood versus the average baseline likelihood.

All three scoring-based estimators (the poverty likelihood of a household, the poverty rate of households at a point in time, and the change in the poverty rate of households over time) are unbiased. That is, they match the true value on average in repeated samples when constructed from (and applied to) a single, unchanging population in which the relationship between scorecard indicators and poverty is constant.

The scorecard works on the assumption that future relationships between indicators and poverty in all possible groups of households will be the same as in the construction data.

The New Forests Company Forests for Prosperity Midterm Evaluation utilized Uganda PPI 2012 Scorecard and Look-up tables. This PPI was created in June 2015 by Mark Schreiner of Microfinance Risk Management L.L.C using data from Uganda's 2012/2013 National Household Survey that was conducted by Uganda Bureau of Statistics (UBOS). Proxy information about daily household expenditure/daily household consumption (Poverty Probability Index) was obtained using ten (10) standard questions with total score per household computed by adding respective scores for each of the ten (10) questions. A PPI score for each household was converted into a poverty-likelihood for each household using a PPI Look-up Table. The Study utilized Look-up Tables that

indicated PPI Scores for \$1.25/day 2005 PPP (Purchasing Power Parity). The corresponding poverty likelihoods were the basis for analysis of household poverty levels and poverty rates for groups of households in particular categories and locations of the study population.

Previously, Poverty Probability Index (PPI) was calculated by FFP Baseline Consultants from FFP Baseline Dataset assembled in December 2018. Presently, PPI has been calculated by FFP Midterm Evaluation Consultants from FFP Midterm Evaluation Dataset assembled in December 2019. PPI obtained during FFP Midterm Evaluation has been compared with PPI obtained during FFP Baseline Study to establish changes in household poverty levels and poverty rates of groups of households in particular categories and locations of the study population between December 2018 and December 2019.

Table 2: NFC FFP Midterm Evaluation PPI Across Project Areas (Baseline PPI Values Indicated In Brackets)

Variable	Kirinya Plantation (n=119)	%	Luwunga Plantation (n=120)	%	Namwasa Plantation (n=123)	%	Mityana Pole Treatment Plant (n=110)	%
Poverty Rate	32.5 (29.1)		27.9 (26.4)		23.2 (32.7)		12.2 (11.5)	
Number of worse-off households (45.3<=PL<=96.7)	29 (44)	24.4 (31.7)	22 (38)	18.3 (26.2)	18 (48)	14.6 (38.1)	2 (4)	1.8 (3.8)
Number of fair households (0.3<=PL<=27.9)	73 (91)	61.3 (65.5)	82 (101)	68.3 (69.7)	85 (73)	69.1 (57.9)	84 (87)	76.4 (82.1)
Total number of households under poverty line (0.3<=PL<=96.7)	102 (135)	85.7 (97.1)	104 (139)	86.7 (95.9)	103 (121)	83.7 (96.0)	86 (91)	78.2 (85.9)
Total number of households on and above poverty line	17 (4)	14.3 (2.9)	16 (6)	13.3 (4.1)	20 (5)	16.3 (4.0)	24 (15)	21.8(14.2)

Table 2 above indicated that there was a 32.5%-likelihood (probability) that households that were sampled and interviewed during midterm evaluation around Kirinya Plantation in Bugiri District were **not on or above** the poverty line. In other words, all households taken together were classified as being **below** the poverty line even though 14.3% of households were found to be on or above the poverty line. A household or group of households was classified as being either on or above the poverty line if the likelihood (probability) that the household or group of households was **not on or above** the poverty line was 0%. Further analysis indicated that a greater number of households (61.3%) around Kirinya Plantation in Bugiri District were on the way towards emerging out of poverty (but still below the poverty line) and a lesser number of households around the same plantation (24.4%) were still under rock bottom poverty levels. *Midterm evaluation PPI results for Kirinya Plantation indicate that between December 2018 and*

December 2019, there was a **reduction** in proportion of households under rock bottom poverty levels, an **increase** in proportion of households on or above poverty line and an **increase** in poverty rate (group poverty). These findings are suggestive of emergent disproportionate wealth distribution in the community around Kirinya Plantation.

Poverty analysis for households that were sampled and interviewed during midterm evaluation around Luwunga Plantation that is located in Kiboga and Kyankwanzi Districts indicated that there was a 27.9%-likelihood (probability) that the investigated households in the stated location were **not on or above** the poverty line. Following standard poverty scorecard rules, all investigated households around Luwunga Plantation taken together were classified as being **below** the poverty line even though 13.3% of households were found to be on or above the poverty line. Further analysis indicated that a greater number of households (68.3%) around Luwunga Plantation that is located in Kiboga and Kyankwanzi Districts were on the way towards emerging out of poverty (but still below the poverty line) and a lesser number of households around the same plantation (18.3%) were still under rock bottom poverty levels. *Midterm evaluation PPI results for Luwunga Plantation indicate that between December 2018 and December 2019, there was a **reduction** in proportion of households under rock bottom poverty levels, an **increase** in proportion of households on or above poverty line and an **increase** in poverty rate (group poverty). These findings are suggestive of emergent disproportionate wealth distribution in the community around Luwunga Plantation.*

Poverty analysis for households that were sampled and interviewed during midterm evaluation around Namwasa Plantation that is located in Kassanda and Mubende Districts indicated that there was a 23.2%-likelihood (probability) that the investigated households in the stated location were **not on or above** the poverty line. Following standard poverty scorecard rules, all investigated households around Namwasa Plantation taken together were classified as being **below** the poverty line even though 16.3% of households were found to be on or above the poverty line. Further analysis indicated that a greater number of households (69.1%) around Namwasa Plantation that is located in Kassanda and Mubende Districts were on the way towards emerging out of poverty (but still below the poverty line) and a lesser number of households around the same plantation (14.6%) were still under rock bottom poverty levels. *Midterm evaluation PPI results for Namwasa Plantation indicate that between December 2018 and December 2019, there was a **reduction** in proportion of households under rock bottom poverty levels, an **increase** in proportion of households on or above poverty line and a **reduction** in poverty rate (group poverty). These findings suggest that the community around Namwasa Plantation is on its way towards emerging out of poverty.*

Poverty analysis for households that were sampled and interviewed during midterm evaluation around Mityana Pole Treatment Plant that is located in Mityana District indicated that there was a 12.2%-likelihood (probability) that the investigated households in the stated location were **not on or above** the poverty line. Following standard poverty scorecard rules, all investigated households around Mityana Pole Treatment Plant taken together were classified as being **below** the poverty line even though 21.8% of households were found to be on or above the poverty line. Further

analysis indicated that a greater number of households (76.4%) around Mityana Pole Treatment Plant that is located in Mityana District were on the way towards emerging out of poverty (but still below the poverty line); and a lesser number of households around the same pole treatment plant (1.8%) were still under rock bottom poverty levels. *Midterm evaluation PPI results for Mityana Pole Treatment Plant indicate that between December 2018 and December 2019, there was a **reduction** in proportion of households under rock bottom poverty levels, an **increase** in proportion of households on or above poverty line and an **increase** in poverty rate (group poverty). These findings are suggestive of emergent disproportionate wealth distribution in the community around Mityana Pole Treatment Plant.*

Table 3: NFC FFP Midterm Evaluation PPI Across CA and NON-CA Members (Baseline PPI Values Indicated in Brackets)

Variable	CA Members (n=180)	%	Non-CA Members (n=157)	%
Poverty Rate	25.2 (29.1)		27.2 (22.0)	
Number of worse-off households (45.3<=PL>=96.7)	38 (69)	21.1 (28.6)	44 (59)	28 (23)
Number of fair households (0.3<=PL>=27.9)	115 (167)	64 (69.3)	86 (173)	54.8 (67.3)
Total number of households under poverty line (0.3<=PL>=96.7)	153 (236)	85 (97.9)	130 (232)	82.8 (90.3)
Total number of households on and above poverty line	27 (5)	15 (2.1)	27 (25)	17.2 (9.7)

Table 3 above indicated that there was a 25.2%-likelihood (probability) that households that were sampled and interviewed during midterm evaluation around the four project locations and whose heads were CA Members were **not on or above** the poverty line. In other words, all households headed by CA Members taken together were classified as being **below** the poverty line even though 15% of households in the stated category were found to be on or above the poverty line. A household or group of households was classified as being either on or above the poverty line if the likelihood (probability) that the household or group of households was **not on or above** the poverty line was 0%. Further analysis indicated that a greater number of households (64%) headed by CA Members around the four project locations were on the way towards emerging out of poverty (but still below the poverty line) and a lesser number of households (21.1%) headed by CA Members around the four project locations were still under rock bottom poverty levels. *Midterm evaluation PPI results for households headed by CA Members around the four project locations indicate that between December 2018 and December 2019, there was a **reduction** in proportion of households under rock bottom poverty levels, an **increase** in proportion of households on or above poverty line and a **reduction** in poverty rate (group poverty). These findings suggest that households headed by CA Members around the four project locations are on their way towards emerging out of poverty.*

Table XXX above indicated that there was a 27.2%-likelihood (probability) that households that were sampled and interviewed during midterm evaluation around the four project locations and whose heads were Non-CA Members were **not on or above** the poverty line. In other words, all households headed by Non-CA Members taken together were classified as being **below** the poverty line even though 17.2% of households in the stated category were found to be on or above the poverty line. A household or group of households was classified as being either on or above the poverty line if the likelihood (probability) that the household or group of households was **not on or above** the poverty line was 0%. Further analysis indicated that a greater number of households (54.8%) headed by Non-CA Members around the four project locations were on the way towards emerging out of poverty (but still below the poverty line) and a lesser number of households (28%) headed by Non-CA Members around the four project locations were still under rock bottom poverty levels. *Midterm evaluation PPI results for households headed by Non-CA Members around the four project locations indicate that between December 2018 and December 2019, there was an **increase** in proportion of households under rock bottom poverty levels, an **increase** in proportion of households on or above poverty line and an **increase** in poverty rate (group poverty). These findings are suggestive of emergent disproportionate wealth distribution in households headed by Non-CA Members around the four project locations. These findings also suggest that households headed by Non-CA Members around the four project locations are sinking further into poverty.*

Table 4: NFC FFP Midterm Evaluation PPI for NFC Laborers (Baseline PPI Values Indicated In Brackets)

Variable	NFC Laborers (n=108)	%
Poverty Rate	19.0 (26.2)	
Number of worse-off households (45.3<=PL>=96.7)	24 (84)	22.2 (28.1)
Number of fair households (0.3<=PL>=27.9)	71 (194)	65.7 (64.9)
Total number of households under poverty line (0.3<=PL>=96.7)	95 (278)	88 (93.0)
Total number of households on and above poverty line	13 (21)	12 (7.0)

Table 4 above indicated that there was a 19.0%-likelihood (probability) that households that were sampled and interviewed during midterm evaluation around the four project locations and whose heads were NFC Laborers were **not on or above** the poverty line. In other words, all households headed by NFC Laborers taken together were classified as being **below** the poverty line even though 12% of households in the stated category were found to be on or above the poverty line. A household or group of households was classified as being either on or above the poverty line if the likelihood (probability) that the household or group of households was **not on or above** the poverty line was 0%.

Further analysis indicated that a greater number of households (65.7%) headed by NFC Laborers around the four project locations were on the way towards emerging out of poverty (but still below the poverty line) and a lesser number of households (22.2%) headed by NFC Laborers around the four project locations were still under rock bottom poverty levels. *Midterm evaluation PPI results for households headed by NFC Laborers around the four project locations indicate that between December 2018 and December 2019, there was a **reduction** in proportion of households under rock bottom poverty levels, an **increase** in proportion of households on or above poverty line and a **reduction** in poverty rate (group poverty). These findings suggest that households headed by NFC Laborers around the four project locations are on their way towards emerging out of poverty.*

Table 5: NFC FFP Midterm Evaluation PPI for Affected Cooperative Members around Luwunga and Namwasa Plantations (Baseline PPI Values Indicated In Brackets)

Variable	Affected Cooperative Members around Luwunga and Namwasa Plantations (n=105)	%
Poverty Rate	34.3 (37.8)	
Number of worse-off households (45.3<=PL>=96.7)	30 (40)	28.6 (47.6)
Number of fair households (0.3<=PL>=27.9)	41 (44)	39.1 (52.4)
Total number of households under poverty line (0.3<=PL>=96.7)	71 (84)	67.6 (100.0)
Total number of households on and above poverty line	34 (0)	32.4 (0.0)

Table 5 above indicated that there was a 34.3%-likelihood (probability) that households that were sampled and interviewed during midterm evaluation around two project locations - Luwunga and Namwasa and whose heads were Affected Cooperative Members were **not on or above** the poverty line. In other words, all households headed by Affected Cooperative Members taken together were classified as being **below** the poverty line even though 32.4% of households in the stated category were found to be on or above the poverty line. A household or group of households was classified as being either on or above the poverty line if the likelihood (probability) that the household or group of households was **not on or above** the poverty line was 0%. Further analysis indicated that a greater number of households (39.1%) headed by Affected Cooperative Members around two project locations - Luwunga and Namwasa were on the way towards emerging out of poverty (but still below the poverty line) and a lesser number of households (28.6%) headed by Affected Cooperative Members around the two project locations were still under rock bottom poverty levels. *Midterm evaluation PPI results for households headed by Affected Cooperative Members around two project locations - Luwunga and Namwasa indicate that between December 2018 and December 2019, there was a **reduction** in proportion of households under rock bottom poverty levels, an **increase** in proportion of households on or above poverty line and a **reduction** in poverty rate (group poverty). These findings suggest that households headed by*

Affected Cooperative Members around two project locations - Luwunga and Namwasa are on their way towards emerging out of poverty.

3.1.2. Availability and Benefits of Financing from OBUL

The CA members invest the money that they get from NFC. The last money received was used to set business of tent hire. Last year Gema Kumwino Credit and Farmers Group from Kirinya in Bugiri District received UGX 6,080,000 from NFC as payment for the work they had done under FP by December, 2018. This money was used by the CA members to setup income generating activities that include Ox for ploughing and Tents and Chairs for hire. No additional loan has been received by the association since then.

CA members are able to get loan from OBUL with the recommendation of NFC. Generally, this has remained the state of affair at the time of the midterm evaluation in December 2019. The gender segregated data is still being analyzed for comparison and will be included in the final version of the report. The loans received by individual members from OBUL still range from UGX 400,000 to UGX 1,200,000 and the interest on the loans is 3% per month payable in 6 months.

While payment from NFC under FP is to associations, loans are given to the individual association members.

Most of the CA members were farmers and traders; they were investing the loan money in those areas of interest. All people who applied for the loans were given, however, there is currently 4 pending applications that cannot proceed until when the current loan holder repay their loans. The new applicants cannot receive loans until after the old loans are paid and the applicants have been informed so, though some do not appear convinced with the explanation.

The CA members consider the loans they receive from OBUL very beneficial as illustrated by the response from some of the recipients of these loans.

The members of CA also reported to have continued benefiting from firefighting training and financial literacy training to teach them how to successfully manage money received from the loans.

The CA (Gema Kumwino) doesn't currently offer any loans to the members; however, the CA members who want to get loans from OBUL get recommendation from the Association without which the loan would not be offered.

The CA members prefer loans from OBUL to those from BRAC because the payment schedule of the Latter is weekly while that of the former is monthly.

3.2 Forest Risk Mitigation

3.2.1. Community understanding of how to mitigate risks,

95% of Community Association members exhibited knowledge of the major risks/threats, while only 60% of non-CA members could eloquently articulate the threats/risks. Respondents from Kirinya, Luwunga and Namwasa plantations indicated forest fires as the one most important threat to NFC in those locations, while theft of company property, mainly chemicals was reported as the biggest risk at the pole treatment plant in Mityana. While, in addition, the community around Kirinya plantation mentioned all the risks on the check-list, communities from other locations observed that others were no longer risk because NFC had put in place measures to mitigate them

3.2.2. Willingness to participate in mitigate risks

When asked about their willingness to help NFC mitigate the identified risks/threats, more members of Community Associations compared to non-CA members indicated willingness. The absolute extent of this relative difference is still under analysis and will be contained in the final version of the report. Individuals that were unwilling to help mitigate risks among some non-CA members indicated themselves or their relatives felt they had been denied jobs with NFC at some point. For example, following change of contractors in Namwasa plantation, all local laborers were laid off and 'workers from other areas of Uganda recruited. The foreign laborers were accused of various forms of crime in the area such as theft of property belonging to local residents, use of vulgar/obscene language and stage-managing risks/threats to create/sustain their employment.

While the desire/willingness to help mitigate risks is important, people need to be equipped with the requisite technical skills and logistical capacity to do so. As can be seen in table below less people possess these attributes than those willing to help, and contract laborers are better equipped, followed but CAs and Non CAs. Given the eminent shift from working with contract labor to CAs, it is important that NFC looks into strengthening these attributes among CAs. Going by project location, Namwasa and Mityana need more capacity building compared to Kirinya and Luwunga.

Table 6: Willingness and Capacity to Mitigate NFC Risks

	Kirinya			Luwunga			Namwasa			Mityana		
	CA	NCA	CL	CA	NCA	CL	CA	NCA	CL	CA	NCA	CL
%age Respondents willing to help NFC Mitigate Risks	100	100	100	100	87	100	97	84	-	100	88	82
%age Respondents with sufficient Knowledge, skills and logistical capacity to	70	69	83	70	69	83	40	53	-	45	60	67

participate in mitigation	Risks												
------------------------------	-------	--	--	--	--	--	--	--	--	--	--	--	--

While the 65%, and 62% of CA members and contract laborers reported to have received some form of training in various aspects of forest protection such as prevention, detection and fighting of fires and other illegal activities, only 4% of non CAs had received similar training. Even those who received training stated that they needed to be provided with Personal Protection Equipment (mainly overalls and gum boots) and some form of transport (motorcycles) to be able to support NFC with the mitigation of (forest) risks. NFC might want to look into designing and disseminating awareness programs on forest protection/risk mitigation targeting ALL forest adjacent communities irrespective of whether they have a direct relationship with the company or not, i.e. mass sensitization sessions.

According to monthly monitoring reports shared with the consultant Table 7 and its adjacent graph) there was a significant reduction in reported cases of major risks/threats between July 2016 and June 2018 in two project areas namely Kirinya and Namwasa. Cases of illegal grazing and cultivation, however, increased in Luwunga. It was reported that these cases had arisen before the introduction of the FP program and although no statistics were available for July to December 2018 it was hoped that introduction of FP was already beginning to yield positive results. Nevertheless NFC will need to prioritize and address the challenges confronting Luwunga in risk mitigation.

Although occupational health and safety was not cited as a risk anywhere during the interviews, the increase in cases in Mityana between 2017 and 2018 as shown in the table and graph below warrants attention of NFC and it may impact negatively on labor productivity and relations with community in the event of injuries or loss of life that may not be compensated to the satisfaction of the affected families.

Table 7: Risk incidence scores available (from the Monthly Monitoring Reports

Site	Year	Kirinya	Luwunga	Namwasa	Mityana
fire incidences	2017	5	5	15	0
	2018	0	0	13	0
Hectares lost to fire	2017	0	18	35	0
	2018	0	0	3	0
Illegal grazing cases	2017	2	13	21	
	2018	0	20	0	
Illegal cultivation	2017	0	18	23	
	2018	0	26	0

	2018	0	1	0	

Theft of timber	2017	6	0	8	
	2018	0	4	0	1
Occupational health cases (Mityana only)	2017	-	-	-	97
	2018	-	-	-	115

3.3 Relationship Indicators

Net Promoter Score

The lead question for establishing Community relationships within communities in the project area was:

“On a scale of zero to ten (0-10), how likely is it that you would recommend a friend or relative to become a member of your Community Association? 1=9-10, 2=7-8, 3=0-6 (Explain to the respondent that 0 is the Lowest Score and 10 is the Highest Score)”

Table 8 below shows responses from different project areas as follows:

Table 8: Net Promotion Score of the CAs at different NFC Project Locations

Variable	Overall	Kirinya	Luwunga	Namwasa	Mityana
Promoters	64.1	60	65.3	48.9	86.1
Passives	26.9	28.6	.4%2	42.6	11.1
Detractors	9.0	11.4	12.2	8.5	2.8

NPS	55.1	48.6	53.1	40.4	83.3
-----	------	------	------	------	------

Results indicate that those who were most proud of their Community Associations were in Mityana followed by Luwunga, then Kirinya and Namwasa came last. This revelation is quite interesting and attracts attention. During the baseline study, it was Kirinya that ranked number one, followed by Luwunga, then Namwasa and Mityana came last. The last came first this time, and others followed. Before delving into possible causes for this, it is good to note that overall, NPS value raised by 23 points from 32 to 55. This is good and encouraging. Standard practice for an acceptable procedure would have given a point rise of 0 – 5 points in a year. This is because included in NPS values are also assessment of the possible rate of adaptation of a practice and this inevitably introduces personal behavior of the participants. Behavioral changes take a painfully long time to manifest as accepted routine behaviour. A point rise of 23 points in one calendar year is an indicator of at least two things, namely:

- 1) It shows that Forests for Prosperity is being embraced at a fast rate as good practice among communities peripheral to NFP Forests; and
- 2) It gives hope that Forests for prosperity could turn out to be self-propagating, one community copying from the neighbor and replicating the good practices.

But what could be the cause for the internal turn-around of Mityana taking the lead? A series of reasons could be given, namely:

- 1) The level of awareness among communities in Mityana was raised quickly and their expectations are then manifested in the anxiety with which they want to join CAs;
- 2) Communities have ‘kept their ears to the ground’ so to speak and came to know of benefits of forming CAs and are working round the clock to do so. So when asked if they would recommend a friend to join a CA group, the answer was obvious, since that is what they are engaged in at present. This appears to be the case since at the time of this review, there were clear indicators that CA formation was at its peak. One CA member had his motorcycle voluntarily dedicated to CA work. Unfortunately the motorcycle was stolen and it was not clear whether the thief was a member of a competing CA group, or was an ordinary thief from town. Whatever the case may have been, CA formation was at its peak.

For relationships between different communities and NFC, the Lead question was:
“On a scale of zero to ten (0-10), how likely is it that you would recommend another Community Association that you know to enter into a new working relationship with New Forests Company? 1=9-10, 2=7-8, 3=0-6 (Explain to the respondent that 0 is the Lowest Score and 10 is the Highest Score)”

Table 9 below shows the NPS to be above 30 for each of the project areas, with an average of 49. Standard NPS values greater than zero are deemed to be generally good and excellent for values 50 and above. This can be regarded as excellent. The score is not only good as indicating excellent relationships between NFC and communities, but is a good indicator of the time when NFC could take advantage to discuss vital issues with communities. NFC must 'hit the nail when it is still hot' so to say, that is, NFC must take advantage of the prevailing cozy relationships with communities buy them-in more, to make the communities feel they are co-owners of the forest with NFC, and that what affects the forest integrity affects them too.

Though Kirinya is in the third position when overall scores are considered, there is no need to fret about this. The score is currently at NPS 48.6. But it must be remembered that the very first COVOX assessment indicated Kirinya NPS to be at 46 (Covox Document, December 2016), then the baseline put it at 63.24 after the baseline assessment, thus having risen by 17.24 points. Now it is at 47.8. Whereas it could be that Kirinya is oscillating within these limits, it could also be that Kirinya benefited from being a star during the baseline assessment with no effective competitor at the time, given that Kirinya was used to pilot the FP project. Now that other project areas have put in effort towards implementing FP, Kirinya's effort diminishes a little. The actual situation shall be determined with subsequent evaluations.

Though good, NPS values for Namwasa and Luwunga areas remain low. Namwasa has maintained this last position since days of FP project inception. This is neither surprising, nor difficult to explain. Namwasa is a very large plantation with disparate communities and most of the CAs there have not yet achieved a year of implementation. At Luwunga the disgruntled members of the cooperative societies who are faced with a dual problem of being dislodged from forest land, and seeing no way out of their predicament due to corrupt officials now managing the cooperative societies gives them no morale to lead in this regard. However, we should not lose sight of the fact that being last in the list of project areas is no indicator of poor perception of their CAs. An NPS score of 35 and above is very good in itself, indicating that Namwasa and Luwunga communities value being members of a CA (see Table XXX below)

Table 9: NPS values for the different Project areas

Variable	Overall	Kirinya	Luwunga	Namwasa	Mityana
Promoters	60.3	59.5	63.6	45.6	72.7
Passives	28.4	29.7	25.5	43.9	14.5
Detractors	11.3	10.8	10.9	10.5	12.7
NPS	49.0	48.7	38.1	35.1	60

With regard to appreciation of working relationships between CA and non-CA members, it is clear that CA members appreciate their relationship with NFC as much as does non-CA members (the villagers who are not members of the CAs). (See Table 10 below). Their appreciation is however, greater than that of Contractors and Outgrowers. The difference between these two sets of groups is a little difficult to explain. We have CA and villagers on the one hand, having better appreciation of NFC, and on the other we have Labour Contractors and Outgrowers with a lesser appreciation. Before delving into details of the two groups, it is worth reminding the reader that the values are not bad in themselves, bearing in mind that an NPS value greater than zero is good in itself (since NPS values range between -100 and +100).

Table 10: NPS values for CAs and non-CA members.

Variable	CAs	Non-CAs	Contractors	Out growers
Promoters	47.9	50.0	50.0	37.5
Passives	28.5	25.0	16.7	41.7
Detractors	23.6	25.0	33.3	20.8
NPS	24.3	25.0	16.7	16.7

The lower NPS value of Contractor and Outgrowers can be explained from problems that befell these two groups in the course of time. Note that during the baseline study, Contractors were noted to be a clearly happy lot with regard to their relationship with NFC, scoring an NPS of 50 then. This value has lowered to about 17, lowering by 33 points. Reasons for this could be:

- i) The perceived feeling that Contract labourers are being cheated by the main Contractor who won the contract from NFC. They feel NFC pays the contract winner a hefty sum but he only pays them paltry wages;
- ii) Labourers feel the winner of the contract is not providing working gear like gum boots and other protective wear
- iii) Labourers feel NFC pays the contract winner but does not bother to look beyond and see if labourers working conditions are ideal or wanting,
- iv) Labourers have come to learn that villagers hate them, accusing them of theft and other malpractices. This makes them hate their job.

Outgrowers, on the other hand, have their own problems, namely:

- i) They feel the market for wood is hard to come-by and this makes NFC buy their goods at give-away prices, causing low morale for tree growing
- ii) They feel the price for wood products could be higher but middlemen spoil the market, buying from them at very low prices and selling at god market prices

- iii) Outgrowers feel NFC has made no effort to make good their pledge to put right interference by middlemen and unscrupulous NFC staff,
- iv) Many outgrowers have lost morale for tree-growing as they see no way out in the foreseeable future.

3.4 Agency

has been a firm foundation laid for improving the household perception of the agency of Community Associations.

The number of CA-Members that can define the goals/ aspirations of their Community Association in Kirinya, Luwunga, Namwasa and Mityana Pole Plant is 81.4%, 100%, 95.9 and 87.2% respectively.

The number of CA-members that think that their Community Association is able to achieve its goals/aspirations on its own in Kirinya, Luwunga, Namwasa and Mityana Pole Plant is 20.9%, 36.7%, 55.1% and 15.4% respectively;

The number of CA-members that think that their Community Association has put in place appropriate measures to achieve its goals/aspirations on its own is Kirinya, Luwunga, Namwasa and Mityana Pole Plant is 39.5%, 42.9%, 44.9% and 12.8% respectively; while

The number of CA-members that think that their CA is able to act or has starting acting towards achieving its goals/aspiration on its own in Kirinya, Luwunga, Namwasa and Mityana Pole Plant is 39.5%, 91.8%, 44.9 and 12.8% respectively.

The above results show that there is an increase in the level at which Households of CA members appreciate their community aspiration. However there is a decrease in the appreciation of the level to which these aspirations can be realized without external output. This state of affair may be a reflection of the status of governance which is prevalent in the general community where by people (or have been made to) believe that there problems have to be solved by or with help of government or external superior entity. Summary of this is contained in the table below while details of these results are as contained in the Annex appended to this report.

Table 11: Perception of Community Association Agency by Members of Community Associations Across Project Areas

Variable	Kirinya	Luwunga	Namwasa	Pole Plant
	%age	%age	%age	%age

<i>Number of CA-Members that can define the goals/aspirations of their Community Association</i>	81.4	100.0	95.9	87.2
<i>Number of CA-members that think that their Community Association is able to achieve its goals/aspirations on its own</i>	20.9	36.7	55.1	15.4
<i>Number of CA-members that think that their Community Association has put in place appropriate measures to achieve its goals/aspirations on its own</i>	39.5	42.9	44.9	12.8
<i>Number of CA-members that think that their CA is able to act or has starting acting towards achieving its goals/aspiration on its own</i>	39.5	91.8	44.9	12.8

3.5 Micro insurance

Results were got qualitatively through Key Informant interviews with officials from institution(s) that is working closely with accessing/ providing (micro) insurance of NFC stakeholders.

The state of the micro insurance is still as it was at the time of the baseline. NFC has to recommend CA members in Kirinya to receive loans from OBUL. Currently the loans received are still between UGX 400,000 and UGX 1,200,000. As a matter of policy, OBUL insures these loans as outlined below:

Credit Life Insurance – These cover the loan in case the borrow dies or is permanently incapacitated. In case of natural death, the insurance company undertakes to pay the loan balance together with the accruing interest. In case the borrower dies in a motor accident, the insurance company undertakes to pay the loan balance plus the accruing insurance. Besides, the insurance company pays the bereaved family a sum of approx. UGX 1,500,000 to help with funeral arrangements. When such insurance is taken to cover small businesses that are borrowing small amounts of money, the insurance is very small and referred to as micro-insurances.

The insurance companies¹ that offer these (micro) insurance to clients of OBUL include ICEA and UAP. With the generally low insurance uptake² at national level, it is still not clear how similar services would be available outside the context of the covering of

¹ This is according to information received from OBUL. It was not possible to cross check this information with the concerned insurance companies.

² The national insurance uptake stood at 0.73% in 2016 (IRA overview of August 15th, 2017)

(microfinance) loans secured from the MFI. It is even more notoriously difficult to ascertain how NFC would come into the picture to catalyze the uptake these services or product among the insurances service provider or their potential clients thus community members.

The CA currently don't have a role in accessing loans from any bank for the members. The location where people confessed to having access to credit facility was in Kyampologama – one of the communities surrounding Namwasa Plantation. Resident of Kyampologoma reported that loans were secured from Tropical Sacco located in Kassanda by individual members of the community on their own. It was not possible to ascertain the interest rates charged on these facilities.

Data about on accessing micro – insurance services at the other NFC project location outside of Kirinya was hard to come by. This is because for example Tropical Sacco located in Kassanda could not easily share information on micro insurance for their member.

4. Conclusions and Recommendations

4.1 Conclusions

- NPS and Agency started in Bugiri and were higher in this area at the time of baseline establishment but other project areas have quickly caught-up and are on a fast-track to implementing FP. Caution, however, has to be exercised in the way this is being done. There could come-in the risk of raising community expectation higher than could be managed in the long run.
- Poverty/Economic situations in Bugiri are still poorer than other project areas. Explanation for this transcends intervention by NFC *per se* and involves the geographical locations of these project areas vis-à-vis that of Bugiri.
- Mityana area yearns for power connection to the National Grid. Though this may not seem a direct responsibility of NFC, it would do a lot of good CSR, and enhancement of FP prospects in this area. What it takes to have the area connected to the National Grid is no more than knowing what to do – i.e., approach the Uganda power-distribution Company (UEDCL) and lobby for this connection (as we write this Report, the UEDCL Promotion in this regard is still ongoing) connection.
- The animosity between imported labourers and locals in Luwunga and Namwasa still continues. For specific unknown reason, the new contractor mainly imported labour from outside Luwunga and Namwasa areas. Locals view this as an NFC

plan to deny them jobs, and animosity is directed towards NFC rather than the Contractor.

- NFC has done much in establishing infrastructure as part of its CSR. However, there is need to put in place sustainability measures for infrastructure handed over to communities..
- Agency is still low in Bugiri and communities around Mityana PTP have higher agency than Bugiri communities which can be attributed to the urban nature of the later community.

4.2 Recommendations

Maintenance of workers across contractors – A mechanism/arrangement should be developed to ensure that change in the contract holders does not result in loss of work for many people especially residents in the location of the plantation.

Whereas good effort has been made in establishing and motivating newly formed CAs, care needs to be exercised in not putting their initial expectations higher than could be managed in future.

End User Monitoring – NFC needs to put in place a mechanism to ensure effective end user monitoring to ensure that the facilities put in places deliver intended benefits to communities.

The willingness of communities to participate in forest risk mitigation is generally high but there will be need for logistical support in form of personal protection equipment to perform forest protection tasks.

Relations of NFC with Opportunity Bank are visibly present in provision of credit facilities. However the aspect of micro insurance needs to be enhanced as it is still beyond being linked to credit loan insurance. The effectiveness of introducing EcoBank in the picture still needs to be assessed further.

To enhance financial inclusion further, it is again recommended that the contractor staff/labourers should be encouraged to open up bank accounts and have their wages paid to bank accounts as opposed to payments by hard cash.

4.3 Challenge

- Whereas Community Associations are created and managed by locals themselves, there was seen a strong inclination to identify them with NFC. This was due to the active involvement of NFC in Community Association activities. There is therefore a risk that members will finally take the community Associations to be NFC organizations whereas this is not the intended goal. Continuous awareness-raising is therefore necessary to alert members that Community Associations are stand-alone entities supposed to exist with or without external support from NFC. This recommendation has repeatedly come-up in reviews and it serves as a constant reminder of this caution.

Annexes

Annex I Consultancy Process

The consultancy process started with the call for proposal in November and will culminate into the presentation of the final report accepted by the client – NFC. The chronological sequence of the different stages of the consultancy process is summarized in the table below:

Table 12: Table Showing Chronological Sequence of Step Involved in this Consultancy Process

Stage of the Consultancy Process	Timing/ Schedule
Response to Call for Consultancy Services	November 01 st , 2019
Reconnaissance Trip to Bugiri	November 29 th – 30 th , 2019
Development of Tools	November 16 th – December 3 rd , 2019
Presentation of Inception Report	December 06 th , 2019
Consideration and Incorporation of Client's Responses to Inception Report	December 7 th , 2019
Recruitment and Training of Enumerators	December 08 th – 09 th , 2019
Field Work	December 09 th – 22 nd , 2019
• Kirinya	December 09 th – 12 th , 2019
• Mityana Pole Treatment Plant	December 16 th – 18 th , 2019
• Namwasa	December 19 th – 20 th , 2019
• Luwunga	December 21 st -22 nd , 2019
Data Entry, Coding, Analysis and Interpretation	January 03 rd – 17 th , 2020
Report Writing	January 07 th – 31 st , 2020
Presentation of Draft Final Report	February 08 th , 2020
Consideration and Incorporation of Client's responses to Draft Report	February 11 th – 18 th , 2020
Sharing of Final Report with Client's Team	February 19 th , 2020
Final Editing of Report	February 20 th – 22 nd , 2020
Submission of Final Report	February 25 th , 2020

Annex II: Terms of Reference

Forests for Prosperity Mid-Term Evaluation

Request for Proposals/Terms of Reference

for the New Forests Foundation

Bugiri, Kassanda, Kiboga, Kyankwanzi, Mityana, and Mubende Districts

Uganda

November 2020

Background

The objective of New Forests Company's (NFC) community development programme is twofold, 1) preserve company value through risk mitigation, and 2) catalyse socio-economic development in communities surrounding the organization's sustainable forestry plantations. As large-land holding, long-term investors in Africa, forestry companies have traditionally spent a significant sum of money on insurance, security and sometimes even fencing to protect their bio-assets.

The New Forests Company was created with the vision that investing in development partnerships with our neighboring communities will ensure that locals become the company's biggest asset rather than a liability. This approach differentiates NFC in the African forestry industry. NFC's triple bottom line business model is based around this vision and has been delivering results for the company and its communities in Uganda since 2005. NFC has registered the New Forests Foundation (NFF) to manage the community development programme.

Forests For Prosperity Programme:

The Forests for Prosperity (FP) programme was a pilot community engagement and risk mitigation approach designed by the communities in Bugiri who neighbor NFC's Kirinya plantation. After doing a satisfaction and feedback survey with community members, NFC learned:

- communities want more jobs and more seedlings for the out grower programme
- communities are not satisfied with the services rendered in the social infrastructure projects
- more than anything, communities want an opportunity to make an income
- communities want to better understand how and when to sell their trees to NFC

As a result of this feedback, NFC saw that the social infrastructure projects were not achieving the objectives of the CSR programme nor the objectives of the community. This called into question whether this approach was delivering sufficient value to the company or the community to justify the costs. The feedback also signaled that the

approach NFC had been following did not foster agency among the communities, and would continue to reinforce a relationship of patronage and unmanaged expectations which would not serve the community or the company in the long term.

In response to this situation, the NFC team sat with the representatives from the communities around the plantation in Bugiri to discuss the feedback and together design a new model that more directly aligned their interests. The community designed the Forests for Prosperity model where villages organize at a parish level into Community Associations (CAs) who are contracted to mitigate risks in their area of the plantation based on mutually agreed indicators. At the end of the year, the company pays the CAs based on their performance.

Both parties are benefitting so much from this programme that the company is now piloting it at the other plantations. A baseline is necessary for the company and the community to understand what is working and what is not working about the FP programme.

Objectives of FP:

- Directly align community interests of prosperity with NFC's interests of a thriving, well protected forest
- Measurably reduce risks to plantation in a cost-effective way
- Measurably increase economic prosperity and agency among neighboring communities
- Increase agency among neighboring communities through co-designing and participatory decision-making throughout
- Build a system that underpins a long-term, mutually beneficial relationship between NFC and communities.

Mid-Term Evaluation Objectives:

The overall objective of the baseline is to test whether FP is achieving its goals of improving community livelihoods and reducing company risks.

Thematic impact areas to focus on should include:

- **Community Prosperity:** to assess this achievement, we believe the researcher will need to focus on the following areas:
 - Assess the current socio-economic state of the communities, ie: Poverty Probability Index
 - Assess economic activity within the CAs, ie: # of loans, average size of loan, demographics of loan recipients, interest rate, average duration of loan, types of activities loans contribute toward, perception of loan recipient on impact of loan on household livelihoods, CA income statement, CA balance sheet

- Assess benefits of Opportunity Bank relationship, ie: # of loans, average size of loan, demographics of loan recipients, interest rate, average duration of loan, types of activities loans contribute toward, perception of loan recipient on impact of loan on household livelihoods
- Assess financial literacy levels (particularly comparing CA members with non-CA members)
- Trust and Animosity within CAs, ie: Net promoter Score (NPS) for their leaders
- **Forest Risk Mitigation:**
 - Understanding of how to mitigate risks, ie: do they know what they are and how to prevent them?
 - Willingness to mitigate risks, ie: how likely are they to help NFC reduce risks?
 - Triangulate these and other scores with risk incidence scores available from the Monthly Monitoring Reports during analysis
- **Relationship Indicators:**
 - Trust and Animosity between the communities and NFC, ie: Net promoter Score (NPS) for CAs, FP programme and for NFC to compare across demographics
- **Agency:**
 - Level of agency people feel to solve their own problems, please note in your proposal the recommended best practice ways of measuring this
- **Micro insurance:**
 - Establish whether any schemes exist that can provide affordable micro insurance products to communities and NFC labor (low income groups who earn about Ugx10,000 per day)

Please note that there has been an FP pilot at Kirinya for the past 18 months and so this needs to be factored into and explained in the findings.

Mid-Term Evaluation Logistics:

- **Locations:** To do this, the researcher will need to carry out assessments with the communities surrounding the NFC's four operations areas:
 - Kirinya Plantation in Bugiri District
 - Namwasa Plantation in Kassanda and Mubende Districts
 - Luwunga Plantation in Kiboga and Kyankwanzi Districts
 - Pole Treatment Plant in Mityana District
- **Demographics:** The researcher will need to target the following demographic groups and be able to analyze the results overall as well as the differences and similarities between groups overall and specifically at each location:
 - o Members of Community Associations
 - o Neighboring community members who are not members of the Community Associations
 - o NFC labourers

- Local government officials and local leaders
- Affected cooperative members (only in Luwunga and Namwasa)
- **Scope:** researchers should survey 20 people from each of the above groups (100 people) on each of the 4 operational areas (400 people total)
- **Timeline:** this exercise will be done against a tight timeline of 6 weeks between signing contract and submitting the final report:
 - Proposal due: Wed 24 Oct
 - Proposal chosen: Mon 29 Oct
 - Final contract signed: Fri 2 Nov
 - Surveys/Data Collection Tools Approved: Fri 9 Nov
 - Research completed: Mon 26 Nov (to achieve this timeline, we recommend you have one data collection team at each of the 4 operational areas simultaneously)
 - Draft Report Submitted: Wed 5 Dec
 - Final Report Submitted: Fri 14 Dec
- **Methodology:** various methods and tools can be used to fulfill the objectives of the Baseline in an open, transparent, and participatory manner. These may include, but are not limited to literature review, key informant interviews, focus group discussions, most significant change testimonies, observations and recordings etc. including a representative sample of women, youth, and other marginalized populations.

Analysis Report:

Analysis Report should offer thorough analysis of the data collected and the themes, patterns that arose, as well as the practical implications of those insights for the programme as it scales up to the new operational areas and gains traction in Kirinya:

- Summary of analysis of all indicators, triangulations, and similarities and differences between demographic groups and across different operational sites.
- SWOT (Strengths, Weaknesses, Opportunities & Threats) Analysis of FP
- Assess the Key Success Factors that have made the programme in Kirinya so successful to date
- Recommendations based on the above analyses to address the challenges of FP during the scale up to ensure FP achieves its objectives
- Review and recommend improvements to the impact monitoring and evaluation processes
- Annex should include all data in a spreadsheet for cross referencing and future use

Individual / Team Competencies:

A strong background in extension work, rural data collection, and insight driven practical analyses will be an added advantage. They must have good analytical skills, excellent reporting writing and presentation skills and be familiar with relevant software for data analysis. The proposal should also indicate the relevant experience in doing

similar work including the ability to facilitate a dialogue with and between different stakeholders while managing expectations.

Proposal Guidelines:

NFF invites consulting firms or individuals to submit a technical and financial proposal showing how they intend to execute the proposed assignment. The proposal should clearly stipulate a strategy for the proposed work, with a detailed time table/work plan indicating explicit milestones against which the progress can be measured by NFF. The Data Collection and Reporting will take a maximum of 6 weeks from contract signing to final report submission.

The technical and financial proposal must:

- Work Plan of activities throughout the 6 week period
- Budget that facilitates those activities
- Include explicit milestones tied to a timeframe and payment schedule with clear start and completion dates
- Define deliverables including an inception report, data collection tools and the format of the final report that comprehensively addresses all the baseline objectives
- Provide the technical skills and qualifications of team members
- Clearly state any support that you will require from NFC or NFF to undertake and complete the assignment on time

Submission and Comparison of Proposals:

All research activities require resources in order to meet established service levels. It is the responsibility of the researcher to budget for and cover these resource costs in the proposal. We will assess proposals based on their technical scope, how well they address the baseline objectives, and the financial cost.

Please submit a written proposal to conduct the baseline according to the specifications noted above, to Alex Kyabawampi alex.kyabawampi@newforests.net on or before Wed 24 October 2018.

Annex III: Tools Used

The New Forests Company Forests for Prosperity Mid-Term Evaluation Household Questionnaire

Basic information		
Date of Interview: ____/____/____(DD/MM/YYYY)	Interviewer's Name:	Respondent Telephone Contact:
Village:	Parish:	Sub county:
District:		

1.0 CHARACTERISTICS OF HOUSEHOLD HEAD/RESPONDENT

(Inform the respondent that it is optional to provide the name. Explain that the name and answers will remain strictly confidential)

- 1.1 Name of Household Head.....
- 1.2 Name of Respondent.....
- 1.3 Gender/Sex of Household Head/Respondent: 1=Male 2=Female
- 1.4 Age of Household Head:
- 1.5 Number of Years Completed in School by Household Head:
- 1.6 Number of Household Members:
- 1.7 Main Economic Activity of Household Head *(where he/she spends most time and gets highest income)*:
- 1.8 Household Daily Expenditure in Uganda Shillings:
- 1.9 Is the Household-Head a Member of a Community Association? 1=Yes 2=No
- 2.0 Have you performed some forest work with NFC in the last eighteen months (May 2017 and November 2018)? 1=Yes as a Contractor 2=Yes as a Casual Worker/Laborer 3=Yes as a CA member 4=Yes, both 1 and 3 5=Yes, both 2 and 3 6=No
- 2.1 Are you an affected Cooperative Member (Luwunga and Namwasa)? 1=Yes 2=No
- 2.2 Does the Household Head have a bank account? 1=Yes 2=No

2.0 PROXY INFORMATION ABOUT HOUSEHOLD EXPENDITURE/CONSUMPTION (POVERTY PROBABILITY INDEX) *(Circle the Correct Score and add to obtain Total Score) (A PPI score **must** be converted into a poverty likelihood using the PPI Look-up Table)*

2.1 How many members does the household have? A. Nine or more (0) B. Eight (3) C. Seven (4) D. Five or Six (6) E. Four (8) F. Three (12) G. Two (21) H. One (28)

2.2 Are all household members ages 6 to 12 currently in school? A. No (0) B. Yes (2) C. No one ages 6 to 12 (5)

2.3 Can the (oldest) female head/spouse read and write with understanding in any language? A. No (0) B. No female head/spouse (0) C. Yes (3)

2.4 What type of material is mainly used for construction of the wall of the dwelling? A. Un-burnt bricks with mud, mud and poles, or other (0) B. Un-burnt bricks with cement, wood, tin/iron sheets, concrete/stones, burnt stabilized bricks, or cement blocks (4)

2.5 What type of material is mainly used for construction of the roof of the dwelling? A. Thatch, or tins (0) B. Iron sheets, concrete, tiles, asbestos, or other (5)

2.6 What source of energy does the household mainly use for cooking? A. Firewood, cow dung, or grass (reeds) (0) B. Charcoal, paraffin stove, gas, biogas, electricity (regardless of source), or other (6)

2.7 What type of toilet facility does the household mainly use? A. No facility/bush/polythene bags/bucket/etc, or other (0) B. Uncovered pit latrine (with or without slab), Ecosan (compost toilet), or covered pit latrine without slab (4) C. Covered pit latrine with slab (6) D. VIP latrine, or flush toilet (11)

2.8 How many mobile phones do members of your household own? A. None (0) B. One (7) C. Two (12) D. Three or more (22)

2.9 Does any member of your household own a radio? A. No (0) B. Yes (7)

2.10 Does every member of the household have at least one pair of shoes? A. No (0) B. Yes (9)

3.0 INFORMATION ABOUT HOUSEHOLD HUMAN CAPITAL

3.1a Have you or any member of your household received any forest protection training in the last eighteen months? (May 2017 and November 2018) 1=Yes 2=No

3.1b If yes, please provide details below (*Where respondents have the liberty to circle (select) more than one option/alternative, make it clear to them when asking*):

Trainer (Organization)	Areas were you trained in (<i>see codes below</i>)

Codes: (1) Prevention of Forest Fires (2) Prevention of Theft of Plantation Forest Produce (3) Prevention of Agricultural Encroachment/Illegal Crop Cultivation (4) Prevention of Illegal Grazing (5) Prevention of Illegal Hunting (6) Prevention of Illegal Charcoal Production (7) Prevention of Illegal Felling of Wetland Trees (8) Others (please specify)	

3.1c IF YES, which of the knowledge and skills acquired during the training are you practicing at (i) NFC plantations?

(ii) outside NFC plantations?

(See Codes below the Table Above)

4.0 INFORMATION ABOUT HOUSEHOLD ACCESS TO CREDIT/LOAN FACILITIES

4.1a What are your sources of capital? a=Loans from bank, b=Loans from groups, c=Friends, d=Savings, e=NFC, f=Others (please specify)

4.1b What Organizations/Groups Offer Credit/Loan Facilities to Your Household? 1=Opportunity Bank 2=BRAC 3=Community Association 4=Other (please specify)

4.1c What was the Total Loan Amount in Uganda Shillings that your household obtained between May 2017 and November 2018?.....

4.1d What types of activities did loans contribute toward?

.....

4.1e What was the impact of the loans on the wellbeing of your household?

.....

5.0 INFORMATION ABOUT HOUSEHOLD COMMUNITY ASSOCIATION NET PROMOTER SCORE

5.1a Are you a member of any Community Association that works with New Forests Company Forests for Prosperity Program? 1 = Yes 2 = No

5.1b If Yes, What is the Name of the Community Association?

5.1c If Yes, in which year did you become a member of the Community Association?

5.2 Community Association Benefits and Challenges

1. Mention **Benefits** enjoyed by Members of Your Community Association

2. In What Ways Do You Think Benefits enjoyed by Members of Your Community Association could be increased?
3. Mention Challenges Faced by Members of Your Community Association
4. In What Ways Do You Think Challenges faced by Members of Your Community Association could be reduced?

5.3 Household Community Association Net Promoter Score

5.3a On a scale of zero to ten (0-10), how likely is it that you would recommend a friend or relative to become a member of your Community Association? 1=9-10, 2=7-8, 3=0-6 (*Explain to the respondent that 0 is the Lowest Score and 10 is the Highest Score*)

5.3b What are the reasons for the rating you indicated in 5.3a above?

.....

6.0 INFORMATION ABOUT HOUSEHOLD NFC NET PROMOTER SCORE

6.1a Have you performed any forest work since you became a member of the Community Association? 1 = Yes 2 = No

6.1b If yes, what kind of forest work have you done since you became a member of the Community Association? (*Where respondents have the liberty to circle (select) more than one option/alternative, make it clear to them when asking*): (1) Prevention of Forest Fires (2) Prevention of Theft of Plantation Forest Produce (3) Prevention of Agricultural Encroachment/Illegal Crop Cultivation (4) Prevention of Illegal Grazing (5) Prevention of Illegal Hunting (6) Prevention of Illegal Charcoal Production (7) Prevention of Illegal Felling of Wetland Trees (8) Others (please specify)

.....

6.2 Household NFC Net Promoter Score

6.2a On a scale of zero to ten (0-10), how likely is it that you would recommend another Community Association that you know to enter into a new working relationship with New Forests Company? 1=9-10, 2=7-8, 3=0-6 (*Explain to the respondent that 0 is the Lowest Score and 10 is the Highest Score*)

6.2b What are the reasons for the rating you indicated in 6.2a above?

7.0 INFORMATION ABOUT FOREST RISKS AND THEIR MITIGATION

7.1a What do you consider to be the most serious threats/hazards faced by Forest Plantations established and managed by New Forests Company? *(Where respondents have the liberty to circle (select) more than one option/alternative, make it clear to them when asking):* (1) Forest Fires (2) Theft of Plantation Forest Produce (3) Agricultural Encroachment/Illegal Crop Cultivation (4) Illegal Grazing (5) Illegal Hunting (6) Illegal Charcoal Production (7) Illegal Felling of Wetland Trees (8) Others (please specify)

7.1b Are you willing to help NFC reduce threats/hazards faced by Forest Plantations indicated in 7.1a above? 1=Yes 2=No

7.1c If No, why are you NOT willing to help NFC reduce threats/hazards to Forest Plantations?

7.1d If yes, under what conditions are you willing to help NFC reduce threats/hazards to Forest Plantations?

7.1e If yes, do you have sufficient knowledge and skills and logistical capacity to participate in prevention/reduction of threats/hazards to NFC Forest Plantations? 1=Yes 2=No

7.1f If No, what specific training and logistical support do you need to enable you to effectively participate in prevention/reduction of threats/hazards to NFC Forest Plantations?

8.0 INFORMATION ABOUT HOUSEHOLD PERCEPTION OF COMMUNITY ASSOCIATION AGENCY

I want to ask you about the ability of your Community Association to define its goals and to act on them.

8.1a What are the aspirations of your Community Association?

8.1b Do you think your Community Association is able to achieve its aspirations on its own? 1=Yes 2=No

8.1c If yes, what are the indicators?

8.1d If no, what are the indicators?

.....

8.1e Is your Community Association able to act towards achieving its aspirations on its own? 1=Yes 2=No

8.1f If yes, what are the indicators?

.....

8.1g If no, what are the indicators?

.....

.....

.....

The New Forests Company
Forests for Prosperity Mid-Term Evaluation
Community Association Questionnaire

Basic information		
Date of Interview: ____/____/____(DD/MM/YYYY)	Interviewer's Name & Signature:	Telephone Contact:
Village:	Parish:	Sub county:
District:		

1.0 CHARACTERISTICS OF RESPONDENT

- 1.1 Name of Respondent.....
- 1.2 Gender/Sex of Respondent: 1=Male 2=Female
- 1.3 Job designation/title:
- 1.4 Highest level of Education: 1= No formal education 2=Primary education 3=Secondary/Certificate
 4=Diploma 5=Bachelors Degree 6=Advanced Degree 7=Other (please specify).....

2.0 GENERAL INFORMATION ABOUT YOUR COMMUNITY ASSOCIATION

- 2.1 Name of Community Association:
- 2.2 What are the types of activities undertaken/supported by the Community Association?
- (a) Loans and Credit Facilities (b) Funeral Support (c) Trading (d) Education (e) Sanitation (f)
 Environmental Management (g) Tree Planting (h) Crop Farming (i) Fish Farming (j) Livestock Rearing (k)
 Poultry Keeping (l) Other (please specify).....
- 2.3a In which year was this Community Association established?
- 2.3b Is your Community Association registered by the Sub-county/District Local Government? 1=Yes
 2=No
- 2.3c If yes, when was your Community Association legally registered? Year.....Month.....
- 2.4 If not registered, why haven't you registered the Community Association?
- a) High cost of registering the Community Association
 b) Difficulty in accessing registration services (distance, poor roads, offices at District HQS)
 c) Lack of knowledge of the process for registering the Community Association

- d) Fear of taxation by Uganda Revenue Authority
- e) Registering the CA is not important for the kind of activities that we undertake/support
- f) Other (please specify).....

2.5a Does your Community Association have a bank account? 1=Yes 2=No

2.5b How many members in your Community Association are **male**?

2.5c How many members in your Community Association are **female**?

2.5d How many members in your Community Association who are **male** have bank accounts?

2.5e How many members in your Community Association who are **female** have bank accounts?

3.0 INFORMATION ABOUT COMMUNITY ASSOCIATION HUMAN CAPITAL

3.1a Have you or any members of the Community Association received any training in the last eighteen months? (May 2017 and November 2018) 1=Yes 2=No

3.1b IF YES, which organization provided the training?

3.1c IF YES, in what areas were you trained in?

.....

3.1d IF YES, in which ways are you or other Community Association members using the knowledge and skills acquired during the training?

.....

4.0 INFORMATION ABOUT COMMUNITY ASSOCIATION ACCESS TO CREDIT/LOAN FACILITIES

4.1a What are the Community Association Sources of Capital? a=Loans from bank, b=Loans from groups, c=Members contributions, d=Friends, e=Savings, f=NFC, g=Others (please specify)

4.1b What Organizations/Groups Offer Credit/Loan Facilities to Your Community Association? 1=Opportunity Bank 2=BRAC 3=Others (please specify)

4.1c What was the Total Loan Amount in Uganda Shillings that your Community Association obtained between May 2017 and November 2018?.....

4.1d What was the Total Savings Amount in Uganda Shillings that was recorded by the Community Association between May 2017 and November 2018?

4.1e How much money for forest risk mitigation did the Community Association receive from NFC between May 2017 and November 2018?

4.1f How much money did the Community Association pay for forest risk mitigation labor between May 2017 and November 2018 (*payment which goes to individuals for the work they do in NFC plantations*)?
.....

5.0 INFORMATION ABOUT COMMUNITY ASSOCIATION LOANS AND CREDIT FACILITIES AND BUSINESS PROFILE

5.1a Does your Community Association have loans and credit facilities for its members? 1=Yes 2=No

5.1b If yes, what was the Total Number of Loans given out between May 2017 and November 2018?

5.1c What was the Average Size of Loan applied for?

5.1d What kind of people mostly applied for the loans? 1=Men 2=Women 3=Youth 4=Traders 5=Farmers 6=Other (please specify)

5.1e What kind of people mostly obtained the loans? 1=Men 2=Women 3=Youth 4=Traders 5=Farmers 6=Other (please specify)

5.1f How many people applied for the loans?

5.1g How many people received the loans?

5.1h What were the reasons for applicants not receiving loans applied for?

5.1i Were the reasons/explanations for not receiving loans provided to applicants? 1=Yes 2=No

5.1j Were the applicants satisfied with the reasons/explanations provided? (*This touches on questions of transparency*) 1=Yes 2=No

5.1k What is the interest rate on loans given out by the Community Association?

5.1l What is the Average Duration of Loans given out by the Community Association?

5.1m What types of activities did loans contribute toward?

5.1n What was the impact of the loans on the wellbeing of borrower households?

5.1o What was the recovery rate of borrowed funds? (indicate a percentage of number of borrower households that returned borrowed funds with interest vis-à-vis number of borrower households that defaulted and had their collateral sold off to recover the borrowed funds).....

5.1p What were the reasons for borrower households' failure to pay back loans?

.....

5.2a Has your Community Association assigned funds to set up group projects? 1=Yes 2=No

5.2b If yes, which group projects has your Community Association invested in?

.....

5.2c If yes, what is the total amount of money in Uganda Shillings that your Community Association has invested in group projects?

5.3a Does the CA have an income statement/profit and loss statement for the period ended 31 July 2018? 1=Yes 2=No

5.3b If yes, does the income statement/profit and loss statement register a **net income** or a **net loss**?
1=Net Income 2=Net Loss (*Request for Documentary Evidence to Validate the Responses*)

5.4a Does the CA have a balance sheet/statement of financial position for the period ended 31 July 2018? 1=Yes 2=No

5.4b If yes, how does the balance sheet indicate the relationship between Assets and Liabilities of the CA? 1=Assets are greater than Liabilities 2=Assets are equal to Liabilities 3=Assets are less than Liabilities
(*Request for Documentary Evidence to Validate the Responses*)

6.0 INFORMATION ABOUT COMMUNITY ASSOCIATION NFC NET PROMOTER SCORE

6.1a Does your Community Association have a working relationship with New Forests Company? 1=Yes 2=No

6.1b If yes, when did the Community Association start having a working relationship with New Forests Company? (Month & Year) I _____

6.1c If yes, how does your Community Association work with New Forests Company? (a) Prevention of Forest Fires (b) Prevention of Theft of Plantation Forest Produce (c) Prevention of Agricultural Encroachment/Illegal Crop Cultivation (d) Prevention of Illegal Grazing (e) Prevention of Illegal Hunting (f) Prevention of Illegal Charcoal Production (g) Prevention of Illegal Felling of Wetland Trees (h) Other (please specify)

6.1d If yes, how does your Community Association **benefit** in the working relationship with New Forests Company?

.....

6.1e If yes, in what ways do you think benefits enjoyed by your Community Association in the working relationship with New Forests Company could be **increased**?

.....

6.1f If yes, mention any **challenges** faced by your Community Association in the working relationship with New Forests Company?

.....

6.1g If yes, in what ways do you think challenges faced by your Community Association in the working relationship with New Forests Company Forests could be **reduced**?

.....

6.2 Community Association NFC Net Promoter Score

6.2a On a scale of zero to ten (0-10), how likely is it that you would recommend another Community Association that you know to enter into a new working relationship with New Forests Company? 1=9-10, 2=7-8, 3=0-6 (*Explain to the respondent that 0 is the Lowest Score and 10 is the Highest Score*)

6.2b What are the reasons for the rating you indicated in 6.2a above?

.....
.....

7.0 INFORMATION ABOUT FOREST RISKS AND THEIR MITIGATION

7.1a What does your Community Association consider to be the most serious threats/hazards faced by Forest Plantations established and managed by New Forests Company? (a) Forest Fires (b) Theft of Plantation Forest Produce (c) Agricultural Encroachment/Illegal Crop Cultivation (d) Illegal Grazing (e) Illegal Hunting (f) Illegal Charcoal Production (g) Illegal Felling of Wetland Trees (h) Others (please specify)

7.1b Is your Community Association willing to help NFC reduce threats/hazards faced by Forest Plantations indicated in 6.1a above? 1=Yes 2=No

7.1c If No, why is your Community Association NOT willing to help NFC reduce threats/hazards to Forest Plantations?

7.1d If yes, under what conditions is your Community Association willing to help NFC reduce threats/hazards to Forest Plantations?

.....

7.1e If yes, does your Community Association have sufficient knowledge and skills and logistical capacity to participate in prevention/reduction of threats/hazards to NFC Forest Plantations? 1=Yes 2=No

7.1f If No, what specific training and logistical support does your Community Association need to enable it to effectively participate in prevention/reduction of threats/hazards to NFC Forest Plantations?

.....

8.0 INFORMATION ABOUT HOUSEHOLD PERCEPTION OF COMMUNITY ASSOCIATION AGENCY

I want to ask you about the ability of your Community Association to define its goals and to act on them.

8.1a What are the aspirations of your Community Association?

.....

.....
8.1b Do you think your Community Association is able to achieve its aspirations on its own? 1=Yes 2=No

8.1c If yes, what are the indicators?

.....
8.1d If no, what are the indicators?

.....
8.1e Is your Community Association able to act towards achieving its aspirations on its own? 1=Yes 2=No

8.1f If yes, what are the indicators?

.....
8.1g If no, what are the indicators?

.....
.....

Annex IV: Interview Guide for Key Informants

The following five questions guided the interviews with key informants. Any follow up/probe questions served to seek or make clarification:

- 1) Tell me what you know about the activities of NFC in your locality
- 2) To what extent are NFC's activities/initiatives aligned with National and Local development plans under your docket?
- 3) How can NFC's activities/initiatives be better aligned to optimize benefits to the sector you head?
- 4) To what extent is your office involved in NFC's activities/initiatives?
- 5) How can your involvement be improved/strengthened to optimize benefits from your expertise?
- 6) On a scale of 0-10, how would you rate NFC's working relationship with relevant stakeholders and why?
- 7) Do you have any other information you want to share with me about NFC's activities?

Annex V: People Consulted as Key Informants

Name(s)	Designation and Institution	Contact District
Naluggya Catherine	Community Development Officer, Department of Community Services - Busimbi Division	Mityana
Serwanga Herbert	District Commercial Officer, Department of Commerce & Trade - Mityana Municipality	Mityana
Kabigumire Arthur	District Forest Officer, Department of Forestry - Mityana Municipality	Mityana
Justine Nantume	Assistant Forestry Officer, Department of Forestry - Mubende Municipality	Mubende
Wilson Babumba:	Chairman, Nalugazi Tweekembe Development Association - Busimbi Division	Mityana
Naisiko Mwamiina	Secretary, Nalugazi Tweekembe Development Association - Busimbi Division	Mityana
Namaganda Emmy	Treasurer, Nalugazi Tweekembe Development Association - Busimbi Division	Mityana
Lekuru Betty	Publicity Secretary, Nalugazi Tweekembe Development Association - Busimbi Division	Mityana
Kundu Rogers	Chairman, Agali Awamu FFS - Kirinya	Bugiri
Joan Asiimwe	CDO, NFC -Kirinya	Bugiri
Mukwaya Esnweri	Plantation Manager, NFC - Kirinya	Bugiri
Joel Bagatya	CDO, NFC - Pole Plant	
Sheila Owor	CDO, NFC - Namwasa	Kassanda
Paul Sanya	CDO, NFC - Luwunga	Kiboga
Kyabawampi Alex	ED, NFF -HQ	Kampala
Isiko	Branch Manager, Iganga Branch, OBUL	misiko@opportunitybank.co.ug Iganga
John Samuel Angopa	Relationship Manager, OBUL	jangopa@opportunitybank.co.ug 0785028082 Iganga
Namazzi Margret	Transformation Manager, OBUL	mnamazzi@opportunitybank.co.ug 0772364902 Kampala
